

Smoking-Material Fire Problem Fact Sheet

U.S. fire departments responded to an estimated 90,800 smoking-material fires in 2010. These fires caused:

- 610 civilian deaths
- 1,570 civilian injuries, and
- \$663 million in direct property damage.

These estimates are derived from the U.S. Fire Administration National Fire Incident Reporting System (NFIRS) and NFPA's annual fire department experience survey.

Smoking-Material Fires in Homes by Leading Item First Ignited in 2006-2010

FACT: Most deaths in home smoking-material fires were caused by fires that started in bedrooms (37%) or in living rooms, family rooms or dens (35%).

FACT: The risk of dying in a home structure fire caused by smoking materials rises with age.

Canada and all 50 U.S. states now require cigarettes sold to be "fire safe," that is, have sharply reduced ignition strength or ability to start fires. The laws were effective everywhere at the end of 2011. See www.firesafecigarettes.org for more details.

Trends in Civilian Deaths in U.S. Smoking Material Home Fires
