from the hundreds of lives lost to the thousands of people injured every year, electrical malfunctions and failures continue to present dangers. To tackle these issues, states have a vital tool in NFPA 70: National Electrical Code® (NEC®). The NEC is the benchmark for safe electrical design, installation, and inspection to protect people and property from electrical hazards. Updated every three years at the national level, it serves as the main conduit for bringing advancements in safety—and the latest electrical technology—into the built environment. However, the NEC can only fulfill this role if states incorporate the updates into the state electrical codes.}

While 80% of U.S. residents expect up-to-date safety codes, nearly one-third of U.S. states have skipped one or more updates in the past 10 years and many have amended the code to remove safety regulations.

Currently, states vary considerably in how promptly and efficiently they adopt the NEC updates. A home built in Pennsylvania, where the state took over five years to adopt the 2008 NEC update and has skipped subsequent editions, will be nearly a decade out of date.Nearly a third of states* have failed to adopt one or more updates and many states amend the code to remove safety requirements.

In an independent survey commissioned by the NFPA Fire & Life Safety Policy Institute, over 80 percent of U.S. residents polled feel that policymakers should make it a priority to ensure electrical and fire safety codes are up-to-date as new technology and safety measures become available, and 86 percent believe that if they purchased a newly-constructed home today, it would meet the most up-to-date codes. To meet these expectations, policymakers must promote prompt and complete adoptions.

The Policy Institute reviewed NEC update practices across the U.S. and commissioned interviews and surveys with individuals recently involved in state level cycles with electrical boards are also more efficient, tending to adopt new updates in about half the time as states that do not use an electrical board.

Prioritize Adoption of the NEC

States that adopt the NEC as part of a package with other codes, for example building, plumbing and energy conservation, take roughly twice as long to do so. Waiting to adopt the NEC updates with other codes creates inevitable delays in advancing electrical safety and technology.

**Consider Costs Holistically and in Context**

Policymakers are concerned with the compliance costs regulations impose but these costs should not be considered in isolation. Every year, electrical-related fires are responsible for over $2 billion in direct property losses. Focusing solely on the cost of compliance ignores the potential benefits of lives and dollars saved through the prevention of fire and accidents.

Attempts to estimate costs should be framed in a way to consider benefit of deaths, injuries and property loss avoided.

* Of the 44 states that adopt a statewide electrical code

**“Legislators are having a more involved role, which wasn’t the case in the past.” — survey participant**

**“I was extremely impressed with the knowledge that these men and women had.” — survey participant**

**“The committee wants to create a safe electrical environment without an undue or unnecessary financial impact to the users, builders, etc.” — survey participant**
Hundreds of participants give their time and expertise to each update. Each panel member represents one of the following interest categories:

- Labor
- Manufacturers
- Enforcer
- Testing Lab
- Consumer
- Utilities
- Special Experts
- Users
- Installers/Maintainers
- Insurers
- Manufacturers

**THE NEC® EQUATION**

The 520 panel members serve on 19 code-making panels. Each panel can have no more than one third of its representation from the same interest category. This principle of balance prevents any single interest category from dominating the process and ensures all voices have the opportunity to be heard. The 520 panel members reviewed and debated more than 5,500 public inputs during 35,000 person-hours.
