2017–18 Honda Clarity Fuel Cell Emergency Response Guide

Prepared for Fire Service, Law Enforcement, Emergency Medical, and Professional Towing Personnel

This guide has been prepared to assist emergency response professionals in identifying a 2017–18 Clarity Fuel Cell vehicle and safely respond to incidents involving this vehicle.

Copies of this guide and other emergency response guides are available for reference or downloading at https://techinfo.honda.com.

For questions, please contact your local Honda Clarity Fuel Cell dealer or Honda Automobile Customer Service at (800) 999-1009.

Honda wishes to thank emergency response professionals for their concern and efforts in protecting Honda customers and the general public.

The Honda Clarity Fuel Cell can be identified by the emblem "Clarity", mounted on the trunk and the emblem "Fuel Cell" located on the trunk and the front fenders.
A Honda Clarity Fuel Cell can also be identified by inspecting the VIN at the three locations shown below.

Characters 4–6 of the VIN will show ZC4 indicating that it is a Honda Clarity Fuel Cell

**JHMZC4*****000001**

VIN plate located on the lower-right corner of the front windshield.

Stamped into the floor panel in front of the passenger seat under a plastic panel marked **FRAME NUMBER**

Printed on the VIN label on the driver’s door opening
Vehicle Dimensions

Vehicle Weight = 4,122 lb. (1,870 kg)
High-Strength and Ultra-High-Strength Steel

The body of the Honda Clarity Fuel Cell is comprised of high-strength steel and ultra-high-strength steel indicated in the colored areas.

Aluminum Body Parts
The body parts indicated in orange are constructed from aluminum alloy.
Seat Belts and Airbags

The Honda Clarity Fuel Cell is equipped with lap/shoulder belts in all seating positions. The front seat belts are equipped with pyrotechnically activated tensioners that help tighten the seat belt in a sufficient crash.

In addition, the Honda Clarity Fuel Cell is equipped with the following airbags:

- Front Airbags - Driver / Front Passenger
- Side Airbags - Driver / Front Passenger
- Side Curtain Airbags – Driver’s Side / Passenger Side (Both Rows)
- Knee Airbag - Driver

In a collision severe enough to deploy one or more of the airbags, the Honda Clarity Fuel Cell electrical system is designed to automatically open the high-voltage electrical contactors. This disconnects the high-voltage battery from the other high-voltage components and stops the flow of electricity in the high-voltage cables.

_Responders should always assume, however, that the high-voltage system is powered on and take the appropriate action described later in this guide to power off the system._

It takes up to 3 minutes for the airbags and tensioners to power off after the 12-volt system has been turned off by following the emergency shutdown procedures provided later in this guide.
12-Volt Battery
A conventional 12-volt battery is located under the front hood of the vehicle. This battery powers the airbags, lights, audio system, and other standard 12-volt system components. In an emergency situation, it may be necessary to disconnect or cut the 12-volt battery negative cable.

High-Voltage Lithium-Ion Battery
In addition to a 12-volt battery, the Honda Clarity Fuel Cell has a lithium-ion battery (drive battery) with a nominal maximum voltage of 346 volts. Housed in a waterproof case, the lithium-ion battery is stored under the floor in the center of the vehicle. This means that the lithium-ion battery body is normally hidden from view.

The battery electrolyte is sealed inside the lithium-ion battery. In the unlikely event that the lithium-ion battery is damaged, there is no danger of electrolyte liquid pouring out in large quantities.
Hydrogen Supply Components

- Fuel Cell Stack
- Sub Hydrogen Tank
- Main Hydrogen Tank
- Hydrogen Supply Line
- Hydrogen Filling Port
Key Components
High voltage flows through easy-to-identify, heavy-duty orange cables. These cables are purposely routed through areas away from the usual cut points.

There are two sections of the high-voltage cables that can be cut in the event of emergency and the high-voltage system needs to be shut down. They can be identified by the labels as shown.

Fuse Box

12-Volt Battery

Cut Point Labels
(Refer to page 19 for more information.)
The Honda Clarity Fuel Cell is designed with a number of built-in features to protect users, bystanders, and emergency responders.

**Crash Detection System**
The vehicle is equipped with sensors that can detect a serious impact to the vehicle. If the impact is severe enough to deploy any airbag, the system controller will automatically shut off the flow of hydrogen and high-voltage electrical current. While the hydrogen flow stops immediately, it takes about 3 minutes before the high-voltage system is completely shut down. If the vehicle is involved in a crash when the vehicle is turned off, the system can stop the flow of hydrogen in some cases.

**Hydrogen Tank Safety Valves**
The hydrogen tanks contain an internal solenoid valve with three safety valves. One prevents backflow during refueling. Another stops the flow of hydrogen when signaled by the system controller. The third is a thermally activated relief device (TPRD) that releases hydrogen from the tanks if the TPRD is exposed to temperatures above approximately 226°F (108°C).

If the pressure relief valve opens, hydrogen will be released directly from the hydrogen tanks in the direction shown below. You may hear a hissing or a roaring as the hydrogen escapes, and it can take up to 5 minutes for a full tank to empty. Although pure hydrogen flames are invisible, you will see colored flames if other parts of the vehicle are burning.

**Hydrogen Sensors**
In addition to the safety valves, four hydrogen sensors are located on the vehicle. If a potentially hazardous leak is detected, the system controller will automatically stop the flow of hydrogen from the tank. A message **Hydrogen Leak Detected. Power Reduced** or **Pull Over When Safe. Hydrogen Leak Detected** will appear in the multi-information display of the gauge assembly.
Lithium-ion Battery Fumes or Fire
A damaged high-voltage lithium-ion battery can emit toxic fumes and the organic solvent used as electrolyte is flammable and corrosive, so responders should wear appropriate personal protective equipment. Even after a lithium-ion battery fire appears to have been extinguished, a renewed or delayed fire can occur. The battery manufacturer cautions responders that extinguishing a lithium-ion battery fire will take a large and sustained volume of water.

**Responders should always ensure that a Honda Clarity Fuel Cell with a damaged battery is kept outdoors and far away from other flammable objects in order to minimize the possibility of collateral fire damage should the battery catch on fire.**

Lithium-ion Battery Fluid
Avoid contact with the high-voltage battery fluid. The high-voltage battery contains a flammable electrolyte that could leak as a result of a severe crash. Avoid any skin or eye contact with the electrolyte as it is corrosive. If you accidentally touch it, flush your eyes or skin with a large quantity of water for at least 5 minutes and seek medical attention immediately.

Electric Shock
Unprotected contact with any electrically charged high-voltage component can cause serious injury or death. Receiving an electric shock from a Honda Clarity Fuel Cell, however, is highly unlikely because of the following:

- Contact with the battery module or other high-voltage components can only occur if they are damaged and the contents are exposed, or if they are accessed without following proper precautions.
- Contact with the electric motor can only occur after one or more components are removed.
- The high-voltage cables can be easily identified by their distinctive orange color, and contact with them can be avoided.

*If severe damage causes high-voltage components to become exposed, responders should take appropriate precautions and wear appropriate insulated personal protective equipment.*

Compressed Hydrogen
The hydrogen used in the Honda Clarity Fuel Cell is a nontoxic and odorless gas. Unlike gasoline and oil, it cannot spill and cannot harm humans, wildlife, or the environment. However, like other fuels, hydrogen is flammable and explosive. Compared to gasoline, for example, when mixed with air, hydrogen has a much larger range of flammability, and its explosive range is also much larger.

*Emergency responders should also know that hydrogen flames are invisible. In addition, hydrogen burns very quickly and radiates less heat than gasoline or other fuels.*
**Submerged Vehicle**

If a Honda Clarity Fuel Cell is submerged or partly submerged in water, first pull the vehicle out of the water. Then, shut down the high-voltage system using one of the two procedures described on the following pages.

Aside from severe damage to the vehicle, there is no risk of an electric shock from touching the vehicle’s body or framework — in or out of the water. If the high-voltage battery was submerged, you may hear noises from the battery as the cells are being discharged from shorting.

---

**Incidents Involving Fire**

If a Honda Clarity Fuel Cell is involved in a fire, follow standard fire-fighting procedures but with this reminder:

Keep away from the rear of the vehicle until the fire is completely out. Each hydrogen tank is equipped with a thermally activated pressure relief device (TPRD). After sufficient exposure of the TPRD to temperatures above approximately 226°F (108°C), the hydrogen gas in the tanks will be released in the direction shown below. You may hear a hissing or roaring as the hydrogen escapes, and it can take up to 5 minutes for a full tank to empty. Although pure hydrogen flames are invisible, you will see colored flames if other parts of the vehicle are burning.
Preventing Current Flow Through High-Voltage Cables

Before attempting to rescue occupants or move a damaged Honda Clarity Fuel Cell, you should reduce the potential for current to flow from the electric motor or the high-voltage battery through the high-voltage cables.

There are two recommended methods for preventing current flow. These are discussed on the following pages.

**BEST METHOD for High-Voltage Shutdown**

*Push and hold the ENGINE START/STOP button for 3 seconds.*

This simple action turns off the vehicle and immediately shuts down the high-voltage system controllers, thereby preventing current flow into the cables. It also cuts power to the airbags and the front seat belt tensioners, though these pyrotechnic devices have up to a 3-minute deactivation time.

To prevent accidental restarting, you must remove the keyless remote from the vehicle and move it at least 20 feet away.

If you cannot locate the keyless remote, you should also do the SECOND-BEST METHOD for high-voltage shutdown (for preventing high-voltage current flow) on the following page.
SECOND-BEST METHOD for High-Voltage Shutdown
Locate and cut the negative 12-volt battery cable and the DC to DC converter cable.

Together, cutting the negative 12-volt battery cable and cutting the DC to DC converter cable immediately turns off and shuts down the high-voltage system controllers, thereby preventing current flow into the high-voltage cables.

1. Pull the hood release handle located on the driver’s left kick panel.

2. Locate the hood latch lever, push the lever, and lift the hood.
SECOND-BEST METHOD for High-Voltage Shutdown

3. Locate the two cut point labels shown, and cut them.

*When cutting the cables, do not allow the cutting tool to contact any surrounding metal parts; electrical arcing could occur, which can ignite any flammable vapors.*

**NOTE:** If you cannot do either method to stop the engine and prevent current flow into the high-voltage cables, use extreme care and do not touch damaged cables as they may be electrically charged.
Extricating Occupants
If you need to cut the vehicle body or use Jaws-of-Life equipment to remove occupants, be sure to stay within the cut zone indicated in the illustration below.

If you need to cut the hood to open it, be sure to stay within the cut zone indicated in the illustration below.
Emergency Towing

The preferred method is to use a flat-bed tow truck. If wheel lift equipment must be used, be sure to suspend the front wheels and release the parking brake.

Be aware that when rolling a Honda Clarity Fuel Cell with the front (drive) wheels on the ground, the electric motor can produce electricity and remains a potential source of electric shock even when the high-voltage system is turned off.

**NOTE:** If the temperature of the fuel cells or high-voltage battery drops below –22°F (–30°C), the fuel cells will not operate nor will the vehicle start.

⚠️ **Warning**

If orange high-voltage cables or high-voltage covers have been damaged, exposing wiring, terminals, or other components, the exposed parts should never be touched. Doing so could result in serious injury or death due to severe burns or electric shock.

If it is not clear whether the exposed wires and terminals are high-voltage components or not, do not touch them.

If touching high-voltage cables and other high-voltage components is unavoidable, personal insulating protective equipment (insulating gloves, protective goggles, and insulating boots) should always be worn.
Emergency Towing

Securing the Vehicle
The recommended tie down locations are indicated in red.

- 2 tie-down slots are located behind the front wheel and in front of the rear wheel
- The front tow hook is located in front of the right-front tire.
- There is no tow hook at the rear.

Acoustic Vehicle Alerting System
The Honda Clarity Fuel Cell is equipped with a acoustic vehicle alerting system and alerts pedestrians that it is approaching with a audible sound when the speed is about 12 mph or less. When pushing the Honda Clarity Fuel Cell, you will hear this sound as the vehicle is being moved.
**Dealer Inspection and Repair**

A damaged Honda Clarity Fuel Cell must be taken directly to an authorized Honda Clarity Fuel Cell dealer for a thorough inspection and repairs. For questions, please contact any authorized Honda Clarity Fuel Cell dealers shown below or Honda Customer Service at (800) 999-1009.

**High-Voltage Battery Recycling**

The high-voltage lithium-ion battery requires special handling and disposal. If disposal is necessary, please contact an authorized Honda Clarity Fuel Cell dealer or American Honda’s Hybrid Battery Consolidation Center at (800) 555-3497 for assistance.
