Submittal Date: Thu Sep 10 19:30:10 EDT 2015

Committee Statement

Committee Statement: This committee-generated FR addresses the fact that storage of liquids is within the scope of the code and should appropriately be addressed by any security measures.
Response Message:
First Revision No. 4-NFPA 30-2015 [Section No. G.1]

G.1 General.
The process used to assess the level of security of a facility is generally referred to as security vulnerability assessment (SVA). The following published guidelines are available to assist the owner and management of a facility to identify, evaluate, and control security hazards:

1. NFPA 730, Guide for Premises Security
2. American Institute of Chemical Engineers–Center for Chemical Process Safety (CCPS), Guidelines for Analyzing and Managing the Security Vulnerabilities of Fixed Chemical Sites
3. API Security Guidelines for the Petroleum Industry
4. API RP 70, Security for Offshore Oil and Natural Gas Operations
5. API RP 70I, Security for Worldwide Offshore Oil and Natural Gas Operations
6. API Standard 1164, Pipeline SCADA Security
7. API/National Petrochemical and Refiners Association, Security Vulnerability Assessment Methodology
8. American Chemistry Council (ACC), Site Security Guidelines for the U.S. Chemical Industry
10. ACC, Transportation Security Guidelines for the U.S. Chemical Industry
13. U.S. Coast Guard, NVIC 11-02 (and other NVICs)

In some cases, a terrorist attack or similar worst-case event will create response complications, such as interruptions to communication between and among the facility fire brigade or response team, facility management, and response personnel, damage to response equipment, or loss of needed personnel. Existing emergency response plans should be updated to address and mitigate such identified potential disruptions to an effective response. Periodic table-top and full-scale drills are strongly recommended to provide a means for proper training and identification of plan weaknesses to be addressed.
