IEC believes introducing current on the equipment grounding conductor during normal operation can create a very dangerous situation that has the potential of causing injury to people. Electronic lighting control switches that utilize the equipment grounding conductor as a return path should be eliminated from the market immediately.

### Committee Statement

**Committee Action:** Rejected  
**Resolution:** As stated in the panel statement for FR 2423, CMP-9 recognizes that there needs to be a reasonable time for manufacturers to make these devices while being able to use existing inventory.
Electronic lighting control switches shall be listed. They shall not introduce current on the equipment grounding conductor during normal operation. The requirement to not introduce current on the equipment grounding conductor shall take effect on January 1, 2020. For installations existing prior to the effective date of 404.2(C) where the grounded conductor has not been provided in the switchbox, and where it is not practical to install a grounded conductor, electronic lighting control switches which introduce current on the equipment grounding conductor shall be permitted. These electronic lighting control switches shall be listed and labeled for use in replacement or retrofit applications only.

Statement of Problem and Substantiation for Public Comment

FR2416 modifying 404.2(C), and FR2423 creating the new 404.22, have significantly changed an important aspect of the original PI1375 submitted by NECA. The intent of PI1375 was to require the installation and use of the grounded conductor and prohibit the installation of electronic controls that utilize the grounding conductor for operation where a grounded conductor has been installed in the switchbox. But in retrofit installations, where the grounded conductor is not installed, electronic controls that utilize the grounding conductor would still be permitted, but only in these applications (retrofit applications). FR 2423 appears to have eliminated any possibility to install an electronic control that utilizes the grounding conductor for operation in retrofit applications, effectively eliminating controls which utilize the grounding conductor for operation from the marketplace.

It is important to allow these devices in retrofit applications for the following reasons:

1. Eliminating these products from the marketplace will lower the level of safety with respect to current on the equipment grounding conductor. Installers, especially homeowners, will quickly realize that devices provided with a terminal or wire for a grounded conductor will work equally well when connected to the equipment grounding conductor. Since the 0.5ma limit placed on current introduced on the grounding conductor by UL standards will not exist for current introduced on the grounded conductor, much higher currents will be introduced on the equipment grounding conductor, especially in residential applications where code enforcement is less prevalent.
2. These products have been listed and in use for many years. UL standards strictly control the amount of current permitted to be introduced on the equipment grounding conductor to no more than 0.5ma.
3. The suggested change to FR 2423 (new 404.22) will require these products to be listed and labeled for use in retrofit installations only where the grounded conductor is not provided in the switch box.
4. Eliminating these products from the marketplace will severely impact the installation of important energy saving controls in existing buildings. The cost of having to run a grounded conductor to the switchbox will make the return on investment unfavorable for many, if not most projects.

The committee should make the suggested revisions to FR2423 to permit electronic controls which utilize the grounding conductor for operation to be installed where the grounded conductor has not been provided at the switchbox for retrofit applications only.

Submittal Date: Mon Sep 21 10:43:03 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-2409-NFPA 70-2015
Statement: This new exception correlates with language placed in 404.2(C) pursuant to SR 2408. It contains only the provisions that are appropriate for the conditions that will apply to the manufacture and listing of electronic switches. It provides relief to the default requirement to sunset the acceptability of these older-designed switches in 2020. They will continue to be acceptable for replacement/retrofit applications into the future, provided they are listed accordingly. The marking requirement will assure that such devices, although listed, will not to be permitted for new work.
Child Care Facility
A building or structure, or portion thereof, for educational, supervisory, or personal care services for more than four children 7 years old or less.

Statement of Problem and Substantiation for Public Comment
The definitions of Educational Occupancy (NFPA 5000-6.1.3.1) and Day Care Occupancy (NFPA 5000-6.1.4.1) and or the definitions found in International Code Council Building Code Chapter 3 definitions and Section 305 clearly describe the number of occupants. The proposed addition of 406.12(D) for Day Care and Educational Facilities clearly makes the requirement of tamper resistant receptacle required, therefore it is not necessary to include "educational" in this definition.

Submittal Date: Tue Sep 22 13:55:09 EDT 2015

Committee Statement
Committee Action: Rejected
Resolution: The word "educational" is included to emphasis the fact that educational facilities are included in the definition of child care facilities as applied to Article 406.
Outlet Box Hood.

A housing shield intended to fit over a faceplate for flush-mounted wiring devices, or an integral component of an outlet box or of a faceplate for flush-mounted wiring devices. The hood does not serve to complete the electrical enclosure; it reduces the risk of water coming in contact with electrical components within the hood, such as attachment plugs, current taps, surge protective devices, direct plug-in transformer units, or wiring devices. It is commonly known as a "bubble cover."

Statement of Problem and Substantiation for Public Comment

The text that I suggest deleting is explanatory material and doesn't belong as part of the definition. It could be informational, although I see no real reason for that either.

Committee Action: Rejected
Resolution: Deletion of the identified wording does not provide clarity or improvement of the definition.
(E) Controlled Receptacle Marking.

All nonlocking-type, 125-volt, 15- and 20-ampere receptacles that are controlled by an automatic control device, or that incorporate control features that remove power from the receptacle for the purpose of energy management or building automation, shall be permanently marked with the symbol shown in Figure 406.3(E) and the wording "controlled" or automatically controlled.

For receptacles controlled by an automatic control device, the marking shall be permitted to be located on the installed receptacle or the receptacle cover plate face and visible after installation. Receptacles incorporating a control feature that remove power shall be marked on the receptacle face and be visible after installation.

In both cases when a multiple receptacle device is used, the required controlled marking and symbol shall denote which receptacle(s) are automatically controlled.

Figure 406.3(E) Controlled Receptacle Marking Symbol.

Exception: The marking shall not be required for receptacles controlled by a wall switch that provide the required room lighting outlets as permitted by 210.70.

Statement of Problem and Substantiation for Public Comment

Public Input 2805 has identified a serious problem with this requirement as it is written in the 2014 NEC. Only the Code Panel or someone familiar with the NEC understands what the marking is intended to mean. This requirement should result in an occupant clearly understanding what the marking means on the face of the receptacle. The submitter of PI 2805 got it right. The term and symbol as used are unfamiliar and inadequate in conveying to the user that the receptacle may be de-activated by an automatic means. Using the term controlled or automatically controlled better conveys to the user (public) that the receptacle outlet can be de-activated by an automatic control such as an energy management system or other means of automatic control. The other significant issue is the inconsistency with Energy Conservation Codes do not recognize the symbol in Fig.406.3(E) and it resembles a symbol for a timer function. Marking the receptacle or cover with the wording "Controlled" or "automatically controlled" will enable the user to better distinguish which receptacle is controlled. The universal power symbol does not get it done. This could be critical if the intended use cannot be interrupted. This comment is intended to benefit the occupants that will be inserting and withdrawing attachment plugs in a manner that is clear that the receptacle is not always in a powered state due to controlling means (automatic or other).

Submittal Date: Sat Sep 19 13:37:10 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: Separable power supplies employing USB connector kits are commercially available and have been installed to any ordinary duplex receptacle’s wire binding screws and push-in terminals without any regard to safety.
(2) Non-Grounding-Type Receptacles.

Where attachment to an equipment grounding conductor does not exist in the receptacle enclosure, the installation shall comply with (D)(2)(a), (D)(2)(b), or (D)(2)(c).

(a) A non-grounding-type receptacle(s) shall be permitted to be replaced with another non-grounding-type receptacle(s).

(b) A non-grounding-type receptacle(s) shall be permitted to be replaced with a ground-fault circuit interrupter-type of receptacle(s). These receptacles or their cover plates shall be marked “No Equipment Ground.” An equipment grounding conductor shall not be connected from the ground-fault circuit-interrupter-type receptacle to any outlet supplied from the ground-fault circuit-interrupter receptacle.

(c) A non-grounding-type receptacle(s) shall be permitted to be replaced with a grounding-type receptacle(s) where supplied through a ground-fault circuit interrupter. Where supplied through the ground-fault circuit interrupter, grounding-type receptacles or their cover plates shall be marked “GFCI Protected” and “No Equipment Ground.” An equipment grounding conductor shall not be connected between the grounding-type receptacles.

Informational Note No. 1: Some equipment or appliance manufacturers require that the branch circuit to the equipment or appliance includes an equipment grounding conductor.

Informational Note No. 2: See 250.114 for a list of cord-and-plug connected equipment or appliances that require an equipment grounding conductor.

Statement of Problem and Substantiation for Public Comment

While it is true that the required marking of a GFCI receptacle that is installed under the replacement rules without an equipment grounding conductor is an indication of that condition, the user and enforcer of the NEC deserve the information that the proposed Informational Notes provide.

In reality, the vast majority of the purchasers of appliances that are supplied by a three-wire cord will simply plug them into a grounding-type receptacle if one is present with or without the informational label you mention in your Panel Statement. Do the Committee members recognize this reality?

Here’s another question for the Committee - since the replacement of non-grounding receptacles with a GFCI one is not always permitted by the NEC, why wouldn’t you want the Informational Notes? It seems you have an obligation to the users and enforcers of the NEC to provide this information.

Submittal Date: Thu Sep 03 15:16:51 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-5104-NFPA 70-2015
Statement: Section 406.4(D)(2)(c) was modified to clarify that the second sentence was applicable to grounding-type receptacles and to clarify that the markings must be visible after installation. Informational notes 1 & 2 were added to better inform user of those situations where the use of replacement Non-Grounding-Type Receptacles is not acceptable.
(2) Non-Grounding-Type Receptacles.

Where attachment to an equipment grounding conductor does not exist in the receptacle enclosure, the installation shall comply with (D)(2)(a), (D)(2)(b), or (D)(2)(c).

(a) A non-grounding-type receptacle(s) shall be permitted to be replaced with another non-grounding-type receptacle(s).

(b) A non-grounding-type receptacle(s) shall be permitted to be replaced with a ground-fault circuit interrupter-type of receptacle(s). These receptacles or their cover plates shall be marked “No Equipment Ground.” An equipment grounding conductor shall not be connected from the ground-fault circuit-interrupter-type receptacle to any outlet supplied from the ground-fault circuit-interrupter receptacle.

(c) A non-grounding-type receptacle(s) shall be permitted to be replaced with a grounding-type receptacle(s) where supplied through a ground-fault circuit interrupter. Where grounding-type receptacles are supplied through the ground-fault circuit interrupter, grounding-type receptacles or their cover plates shall be marked “GFCI Protected” and “No Equipment Ground”, visible after installation. An equipment grounding conductor shall not be connected between the grounding-type receptacles.

Statement of Problem and Substantiation for Public Comment

1. Cover plates are not typically powered (unless illuminated type) or supplied by the GFCI.

2. Public Input PI 140 and First Revision FR 5104, as worded and taken literally, could STILL allow these markings to appear on the REVERSE side of the receptacle or its cover plate, OUT OF SIGHT from the user these markings are intended to inform.

For an example of literal compliance gone wrong for issue #2, refer to http://bit.ly/1GqfRdy [Illustrated EC&M article by Russ LeBlanc, submitter of PI 140 but unmentioned in his Public Input 140 submittal or its Substantiation.]

Resolution: SR-5104-NFPA 70-2015
Statement: Section 406.4(D)(2)(c) was modified to clarify that the second sentence was applicable to grounding-type receptacles and to clarify that the markings must be visible after installation. Informational notes 1 & 2 were added to better inform user of those situations where the use of replacement Non-Grounding-Type Receptacles is not acceptable.
(4) Arc-Fault Circuit-Interrupter Protection.

Where a receptacle outlet is supplied by a branch circuit that requires arc-fault circuit-interrupter protection as specified elsewhere in this Code, a replacement receptacle at this outlet shall be one of the following:

1. A listed outlet branch-circuit type arc-fault circuit-interrupter receptacle
2. A receptacle protected by a listed outlet branch-circuit type arc-fault circuit-interrupter type receptacle
3. A receptacle protected by a listed combination type arc-fault circuit-interrupter type circuit breaker

Exception No. 1: Arc-fault circuit-interrupter protection shall not be required where all of the following apply:

1. The replacement complies with 406.4(D)(2) (b).
2. It is impracticable to provide an equipment grounding conductor as provided by 250.130(C).
3. A receptacle protected by a listed combination type arc-fault circuit-interrupter circuit breaker is not commercially available.
4. There is no GFCI/AFCI combination receptacle commercially available.

Exception No. 2: 210.12(B) exception does not apply to replacement of receptacles.

Statement of Problem and Substantiation for Public Comment

By adding “all of the following” would make it clear that they would have to meet all of the four conditions before not installing AFCI protection. I am not sure if that is what was intended by this or not. Even after attending the Western Section Meeting no one had mentioned that it had to follow all 4 to qualify for the exemption. I definitely feel by not adding “all of the following” it will be misinterpreted and will counterdict what the blue commentary in the NEC handbook states why it is important to get AFCI protection in the older homes. I was originally going to put in a comment to take out this exemption entirely, but there has been cases where you would have to completely rewire a house to get AFCI protection because of multiwire circuits without an equipment ground and not able to get a ground fished into the outlet.

Submittal Date: Thu Sep 24 14:37:03 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-5105-NFPA 70-2015
Statement: Reference to sections 210.12(A) or (B) was added to clarify where Arc-Fault Circuit Interruption is required. In Exception No. 1, sub-item 4, the word “combination” was replaced with “dual function” to eliminate the potential for confusion since the word “combination” when used with AFCI protection usually refers to protection against series arc and parallel arcs. The phrase “all of the following apply” was added to Exception No. 1 to clarify the application of the four sub-items. Additionally Exception No. 1, sub-item 3 was changed to clarify that it applies to the availability of the circuit breaker rather than the receptacle.
(4) Arc-Fault Circuit-Interrupter Protection.

Where a receptacle outlet is supplied by a branch circuit that requires arc-fault circuit-interrupter protection as specified elsewhere in this Code, a replacement receptacle at this outlet shall be one of the following:

1. A listed outlet branch-circuit type arc-fault circuit-interrupter receptacle
2. A receptacle protected by a listed outlet branch-circuit type arc-fault circuit-interrupter type receptacle
3. A receptacle protected by a listed combination type arc-fault circuit-interrupter type circuit breaker

Exception No. 1: Arc-fault circuit-interrupter protection shall not be required where:

1. The replacement complies with 406.4(D)(2)(b).
2. It is impracticable to provide an equipment grounding conductor as provided by 250.130(C).
3. A receptacle protected by a listed combination type arc-fault circuit-interrupter circuit breaker is not commercially available.
4. There is no GFCI/AFCI combination receptacle commercially available.

Exception No. 2: 210.12(B) exception does not apply to replacement of receptacles.

Statement of Problem and Substantiation for Public Comment

I'm sorry but I'm totally confused as to what this exception is attempting to accomplish, and if the exceptions apply to (4)(3), or just (3). I suggest that the panel attempt to rewire with more clarity.

Committee Statement

Committee Action: Rejected
Resolution: The exceptions are intended to assist the installer when encountering installations that cannot be met based upon installation and product limitations.
Arc-Fault Circuit-Interrupter Protection.

Where a receptacle outlet is supplied by a branch circuit that requires, would require, arc-fault circuit-interrupter protection as specified elsewhere in this Code, if being installed under this code, a replacement receptacle at this outlet shall be one of the following:

1. A listed outlet branch-circuit type arc-fault circuit-interrupter receptacle
2. A receptacle protected by a listed outlet branch-circuit type arc-fault circuit-interrupter type receptacle
3. A receptacle protected by a listed combination type arc-fault circuit-interrupter type circuit breaker

**Exception No. 1:** Arc-fault circuit-interrupter protection shall not be required where:

1. The replacement complies with 406.4(D)(2)(b).
2. It is impracticable to provide an equipment grounding conductor as provided by 250.130(C).
3. A receptacle protected by a listed combination type arc-fault circuit-interrupter circuit breaker is not commercially available.
4. There is no GFCI/AFCI combination receptacle commercially available.

**Exception No. 2:** 210.12(B) exception does not apply to replacement of receptacles.

Statement of Problem and Substantiation for Public Comment

The current wording implies that the AFCI is not needed for a replacement receptacle if the existing branch circuit did not require AFCI protection at the time the branch circuit was installed. This change makes the code clearly reflect the intent of the rule.

### Public Comment No. 632-NFPA 70-2015 [Section No. 406.4(D)(4)]

(4) Arc-Fault Circuit-Interrupter Protection.

Where a receptacle outlet is supplied by a branch circuit that requires arc-fault circuit-interrupter protection as specified elsewhere in this Code and is located in any of the areas specified in sections 210.12(A) or (B), a replacement receptacle at this outlet shall be one of the following:

1. A listed outlet branch-circuit type arc-fault circuit-interrupter receptacle
2. A receptacle protected by a listed outlet branch-circuit type arc-fault circuit-interrupter type receptacle
3. A receptacle protected by a listed combination type arc-fault circuit-interrupter type circuit breaker

Exception No. 1: Arc-fault circuit-interrupter protection shall not be required where:

1. The replacement complies with 406.4(D)(2) (b).
2. It is impracticable to provide an equipment grounding conductor as provided by 250.130(C).
3. A receptacle protected by a listed combination type arc-fault circuit-interrupter circuit breaker is not commercially available.
4. There is no GFCI/AFCI combination receptacle commercially available.

Exception No. 2: 210.12(B) exception does not apply to replacement of receptacles.

---

### Statement of Problem and Substantiation for Public Comment

I disagree with the Committee statement on Public input 390-NFPA70-2014. The present "literal" wording in fact DOES force the electrician to determine whether there are any other outlets on the same branch circuit since the wording states... "supplied by a branch circuit that requires AFCI protection".... For example a receptacle installed outside does not need AFCI protection since OUTSIDE is not one of the areas specified in section 210.12(A). However, if that outside receptacle is on a branch circuit that also supplies power to the bedroom outlets then AFCI protection would be needed for the outside receptacle since branch circuits supplying bedroom outlets ARE required to have AFCI protection. How would the electrician know if any other outlets are on the same branch circuit with the outside outlet unless he went through the entire building to make sure that no other outlets are on the same circuit? If the outside outlet was on an individual circuit then it would not need AFCI protection according to 210.12. But how would you know unless you went to every room in the building to make sure there was not some other receptacle hidden behind a dresser or a couch? I think my proposed wording will help simplify the process and still increase the level of safety for those receptacles installed in any areas requiring AFCI protection.

The phrase "all of the following apply" was added to Exception No. 1 to clarify the application of the four sub-items. Additionally Exception No. 1, sub-item 3 was changed to clarify that it applies to the availability of the circuit breaker rather than the receptacle.
Public Comment No. 908-NFPA 70-2015 [Section No. 406.4(D)(4)]

(4) Arc-Fault Circuit-Interrupter Protection.

Where a receptacle outlet is supplied by a branch circuit that requires arc-fault circuit-interrupter protection as specified elsewhere in this Code, a replacement receptacle at this outlet shall be one of the following:

1. A listed outlet branch-circuit type arc-fault circuit-interrupter receptacle
2. A receptacle protected by a listed outlet branch-circuit type arc-fault circuit-interrupter type receptacle
3. A receptacle protected by a listed combination type arc-fault circuit-interrupter type circuit breaker

Exception No. 1: Arc-fault circuit-interrupter protection shall not be required where:

1. The replacement complies with 406.4(D)(2) (b).
2. It is impracticable to provide an equipment grounding conductor as provided by 250.130(C).
3. A receptacle protected by a listed combination type arc-fault circuit-interrupter circuit breaker is not commercially available.
4. There is no GFCI/AFCI combination dual function receptacle commercially available.

Exception No. 2: 210.12(B) exception does not apply to replacement of receptacles.

Statement of Problem and Substantiation for Public Comment

IEC's position is to replace the word "combination" with "dual function" in 406.4(D)(4) exception 1 item 4 - (FR 5105)

The word combination as used with AFCI protection refers to series arcs and parallel arcs. Dual function means that the device can provide more than one protection method.

Committee Action: Rejected but see related SR
Resolution: SR-5105-NFPA 70-2015
Statement: Reference to sections 210.12(A) or (B) was added to clarify where Arc-Fault Circuit Interruption is required. In Exception No. 1, sub-item 4, the word "combination" was replaced with "dual function" to eliminate the potential for confusion since the word "combination" when used with AFCI protection usually refers to protection against series arc and parallel arcs. The phrase "all of the following apply" was added to Exception No. 1 to clarify the application of the four sub-items. Additionally Exception No. 1, sub-item 3 was changed to clarify that it applies to the availability of the circuit breaker rather than the receptacle.
406.5   Receptacle Mounting.

Receptacles shall be mounted in identified boxes or assemblies. The boxes or assemblies shall be securely fastened in place unless otherwise permitted elsewhere in this Code. Screws used for the purpose of attaching receptacles to a box shall be of the type provided with a listed receptacle, or shall be machine screws having 32 threads per inch or part of listed assemblies or systems, in accordance with the manufacturer’s instructions.

(A)   Boxes That Are Set Back.

Receptacles mounted in boxes that are set back from the finished surface as permitted in 314.20 shall be installed such that the mounting yoke or strap of the receptacle is held rigidly at the finished surface.

(B)   Boxes That Are Flush.

Receptacles mounted in boxes that are flush with the finished surface or project therefrom shall be installed such that the mounting yoke or strap of the receptacle is held rigidly against the box or box cover.

(C)   Receptacles Mounted on Covers.

Receptacles mounted to and supported by a cover shall be held rigidly against the cover by more than one screw or shall be a device assembly or box cover listed and identified for securing by a single screw.

(D)   Position of Receptacle Faces.

After installation, receptacle faces shall be flush with or project from faceplates of insulating material and shall project a minimum of 0.4 mm (0.015 in.) from metal faceplates.

Exception: Listed kits or assemblies encompassing receptacles and nonmetallic faceplates that cover the receptacle face, where the plate cannot be installed on any other receptacle, shall be permitted.

(E)   Receptacles in Countertops.

Receptacle outlets, assemblies, for installation in countertops, countertop surfaces, shall be listed for countertop applications. Where receptacle assemblies for countertop applications are required to provide ground-fault circuit-interrupter protection for personnel in accordance with 210.8, such assemblies shall be permitted to be listed as GFCI receptacle assemblies for countertop applications.

(F)   Receptacles in Work Surfaces.

Receptacle outlet assemblies and GFCI receptacle assemblies listed for use in work surfaces, or countertop applications, shall be permitted to be installed in work surfaces.

(G)   Receptacle Orientation.

Receptacles shall not be installed in a face-up position in countertops, or on countertop surfaces or work surfaces unless listed for the purpose of countertop or work surface applications.

(H)   Receptacles in Seating Areas and Other Similar Surfaces.

In seating areas or similar surfaces, receptacles shall not be installed in a face-up position unless the receptacle is any of the following:

(1) Part of an assembly listed as a furniture power distribution unit
(2) Part of an assembly listed either as household furnishings or as commercial furnishings
(3) Listed either as a receptacle assembly for countertop applications or as a GFCI receptacle assembly for countertop applications
(4) Installed in a listed floor box

(I)   Exposed Terminals.

Receptacles shall be enclosed so that live wiring terminals are not exposed to contact.

(J)   Voltage Between Adjacent Devices.

A receptacle shall not be grouped or ganged in enclosures with other receptacles, snap switches, or similar devices, unless they are arranged so that the voltage between adjacent devices does not exceed 300 volts, or unless they are installed in enclosures equipped with identified, securely installed barriers between adjacent devices.

Statement of Problem and Substantiation for Public Comment

There are differences between the terms “receptacle”, “receptacle outlet” and “receptacle assembly”. The Panel is confusing Article 100 Code-defined terms with imprecise commercial vernacular in 406.5(E) and new 406.5(F). Also FR 5108 now uses the terms inconsistently throughout these subsections of 406.5. Compare FR 5108’s new first sentence’s use of “receptacle outlets” with “receptacle assemblies” in the second sentence for 406.5(E), as an example. Compare FR 5108’s use of “receptacle outlets” in...
406.5(E) and new 406.5(F) with “receptacle assemblies” in renumbered 406.5(H)(3), as another example.

As presently written in FR5108, this imprecise use of terms could be ambiguously misinterpreted that REGULAR receptacles (i.e., “Receptacle outlets”) installed in VERTICAL backsplashes of countertops (i.e., NOT mounted face-up but face-out) would now have to be ADDITIONALLY listed as suitable for countertop applications. This ambiguity would preclude most eligible listed receptacles (installed FACE-OUT on countertop backsplashes) that are presently permitted because those would not be “listed for countertop applications”.

In accordance with NEC® Style Manual 2.1.5.2, titles are needed for new subdivisions 406.5(F) and 406.5(G). Subdivision titles should also appear consistently in boldface type.

In accordance with NEC® Style Manual 3.2.1, new 406.5(G)’s “for the purpose” is a vague and unenforceable term.

### Committee Statement

- **Committee Action:** Accepted
- **Resolution:** SR-5106-NFPA 70-2015
- **Statement:**
  406.5 (E) and (F) were reworded slightly to clarify that they apply only to horizontally mounted receptacle assemblies and not to assemblies mounted vertically in a counter backsplash. In accordance with NEC® Style Manual 2.1.5.2, titles were added for new subdivisions 406.5(F) and 406.5(G). Subdivision titles should also appear consistently in boldface type. In accordance with NEC® Style Manual 3.2.1, new 406.5(G)’s “for the purpose” is a vague and unenforceable term and has been replaced by “countertop or work surface applications”.

Public Comment No. 468-NFPA 70-2015 [Sections 406.5(F), 406.5(G)]

Sections 406.5(F), 406.5(G)

(F) Listed for Work Surfaces.
Receptacle outlet assemblies listed for use in work surfaces or countertops shall be permitted to be installed in work surfaces.

(G) Face-Up Placement.
Receptacles shall not be installed in a face-up position in countertops or work surfaces unless listed for the purpose.

Statement of Problem and Substantiation for Public Comment

I suggested some titles.

Submittal Date: Sun Aug 30 14:31:04 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: The titles suggested do not accurately reflect the content. See revision to section 406.5 (Second Revision No. 5106).
406.13 Locking Support and Mounting Receptacle and Attachment Fitting Combination.

(A) Locking support and mounting receptacle shall be listed and marked with the manufacturer's name or identification, and voltage and ampere rating.

(B) Listing locking support and mounting receptacle in combination with recognized attachment fitting shall be permitted to support and supply ceiling- or wall-luminaires and ceiling-suspended luminaires, and ceiling-suspended (paddle) fans.

(C) Locking support and mounting receptacle and attachment fitting combinations shall be of the grounding-type and shall be connected to the equipment grounding conductors in accordance with 250.130(C).

(D) Locking support and mounting receptacle and attachment fitting combinations used to connect and support ceiling-suspended (paddle) fans and luminaires shall only be permitted to be used with outlet boxes conforming to 314.27(E) installed as required by 314.23.

Informational Note: Locking support and mounting receptacles when used in conjunction with compatible attachment fitting are designed to connect, supply and support individual ceiling- or wall-mounted luminaires and ceiling-suspended (paddle) fans.

Statement of Problem and Substantiation for Public Comment

SUBSTANTIATION:
New text was proposed and approved for 314.27(E) by CMP 9 in FR 2411 that read as follows:

(E) Separable Attachment Fittings. Outlet boxes shall be permitted to support listed locking support and mounting receptacles used in combination with compatible attachment fittings designed for the support of equipment covered within and subject to all weight and orientation limits contemplated by the listing. Where such fittings are used, the equipment mounted shall comply with 314.27(A) through (D) as applicable. Where the supporting receptacle is installed within a box, it shall be included in the fill calculation covered in 314.16(B)(4).

This proposed new text in 406.13 is needed because it coordinates with the new 314.27(E), and must also be covered under the article on receptacles for clarity.

Submittal Date: Tue Sep 15 15:15:33 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: Item (A) is unnecessary since receptacles are already required to be listed. The panel interprets the use of the word "recognized" in item (B) to refer to Qualified Testing Laboratory recognition. The Qualified Testing Laboratory component recognition programs are not acknowledged in the code. The item (D) reference to 314.27(E) is superfluous as 314.27(E) stands on its own. A new section in the code is not required since AHJ's look for the certification mark to determine suitability of product for the installation along with other requirements. As a listed or certified product there is no prohibition for its installed use. See Second Revision No. 5128.
### 406.12 Tamper-Resistant Receptacles.

Tamper-resistant receptacles shall be installed as specified in 406.12(A) through (G).

**A** Dwellings Units.

In all areas specified in 210.52 and 550.13, all nonlocking-type 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.

**B** Guest Rooms and Guest Suites of Hotels and Motels.

All nonlocking-type 15- and 20-ampere receptacles located in guest rooms and guest suites of hotels and motels shall be listed tamper-resistant receptacles.

**C** Child Care Facilities.

In all child care facilities, all nonlocking-type 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.

**D** Preschools and Elementary Education Facilities.

All nonlocking-type, 15- and 20-ampere receptacles located in preschools and elementary education facilities shall be listed tamper-resistant receptacles.

**E** Business Offices, Corridors, Waiting Rooms and the Like in Clinics, Medical and Dental Offices and Outpatient Facilities.

All nonlocking-type, 15- and 20-ampere receptacles located in business offices, corridors, waiting rooms, and the like in clinics, medical and dental offices, and outpatient facilities shall be listed tamper-resistant receptacles.

**F** Subset of Assembly Occupancies Described in Article 518.2 to Include Places of Waiting Transportation, Gymnasiums, Skating Rinks, and Auditoriums.

All nonlocking-type, 15- and 20-ampere receptacles located in places of waiting transportation, gymnasiums, skating rinks, and auditoriums shall be listed tamper-resistant receptacles.

**G** Dormitories.

All nonlocking-type, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.

Exception to (A), (B), (C), and (D), (E), (F), and (G): Receptacles in the following locations shall not be required to be tamper resistant:

1. Receptacles located more than 1.7 m (5 1/2 ft) above the floor
2. Receptacles that are part of a luminaire or appliance
3. A single receptacle or a duplex receptacle for two appliances located within the dedicated space for each appliance that, in normal use, is not easily moved from one place to another and that is cord-and plug-connected in accordance with 400.10(A)(6), (A)(7), or (A)(8)
4. Non-grounding receptacles used for replacements as permitted in 406.4(D)(2)(a)

---

**Statement of Problem and Substantiation for Public Comment**

There was no technical substantiation for these changes. Exactly how many injuries have occurred in the waiting are of ice skating rinks? Furthermore, this rule was about protecting children, so why are we installing them in dormitories? I was one of only two people in the state of Utah who argued FOR tamper resistant receptacles in 2008 when our legislature was trying to get rid of them. I am an advocate and a believer in these devices, but the creation of new rules needs to be the result of real world incidents, data, and cost benefit analysis.

406.12  Tamper-Resistant Receptacles.

Tamper-resistant receptacles shall be installed as All 15- and 20-ampere, 125- and 250-volt nonlocking-type receptacles in the areas specified in 406.12(A) through (G) shall be listed tamper-resistant receptacles.

Informational Note: The types of receptacles covered by this requirement are identified as 5-15, 5-20, 6-15 and 6-20 in ANSI/NEMA WD 6-2012, Standard for Dimensions of Attachment Plugs and Receptacles.

(A)  Dwelling Units.
In all areas specified in 210.52 and 550.13, all nonlocking-type 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.

(B)  Guest Rooms and Guest Suites of Hotels and Motels.
All nonlocking-type 15- and 20-ampere receptacles located in guest rooms and guest suites of hotels and motels shall be listed tamper-resistant receptacles.

(C)  Child Care Facilities.
In all child care facilities, all nonlocking-type 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.

(D)  Preschools and Elementary Education Facilities.
All nonlocking-type, 15- and 20-ampere receptacles located in preschools and elementary education facilities shall be listed tamper-resistant receptacles.

(E)  Business Offices, Corridors, Waiting Rooms and the Like in Clinics, Medical and Dental Offices and Outpatient Facilities.
All nonlocking-type, 15- and 20-ampere receptacles located in business offices, corridors, waiting rooms, and the like in clinics, medical and dental offices, and outpatient facilities shall be listed tamper-resistant receptacles.

(F)  Subset of Assembly Occupancies Described in Article 518.2 to Include Places of Waiting Transportation, Gymnasiums, Skating Rinks, and Auditoriums.
All nonlocking-type, 15- and 20-ampere receptacles located in places of waiting transportation, gymnasiums, skating rinks, and auditoriums shall be listed tamper-resistant receptacles.

(G)  Dormitories.
All nonlocking-type, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.

Exception to (A), (B), (C), (D), (E), (F), and (G): Receptacles in the following locations shall not be required to be tamper resistant:

1. Receptacles located more than 1.7 m (5 1/2 ft) above the floor
2. Receptacles that are part of a luminaire or appliance
3. A single receptacle or a duplex receptacle for two appliances located within the dedicated space for each appliance that, in normal use, is not easily moved from one place to another and that is cord-and-plug-connected in accordance with 400.10(A)(6), (A)(7), or (A)(8)
4. Nongrounding receptacles used for replacements as permitted in 406.4(D)(2)(a)

Statement of Problem and Substantiation for Public Comment

The intent is to cover the common receptacles found in these locations and not to apply this requirement to special configurations that may be required for certain dedicated equipment where tamper-resistant devices are not available. The language was also changed so as not to repeat the common requirement in each paragraph.

Public Comment No. 1125-NFPA 70-2015 [Section No. 406.12(D)]

**Statement of Problem and Substantiation for Public Comment**

By specifying public and private educational facilities no ambiguous application or need for interpretation is required by either designers or inspectors what facilities tamper resistant receptacles are required. Elementary schools, typically K through 6th, encompasses children ages 5 to 11 and setting a 2nd grade cap (normally age 7) is a reasonable limit to protect children who are not necessarily aware of the dangers of placing foreign objects into receptacles.

Submittal Date: Wed Sep 23 20:33:40 EDT 2015

**Committee Statement**

Committee Action: Rejected  
Resolution: The NEC applies to any installation public or private. It is also based upon a child's age not educational grade (i.e. pre-K through 2nd).
Public Comment No. 308-NFPA 70-2015 [Section No. 406.12(F)]

(F) Subset of Assembly Occupancies Described in Article 518.2 to Include Places of Waiting Transportation, Gymnasiums, Skating Rinks, and Auditoriums.

All nonlocking-type, 15- and 20-ampere receptacles located in places of waiting transportation, gymnasiums, skating rinks, and where accessible to the general public in auditoriums shall be listed tamper-resistant receptacles.

Statement of Problem and Substantiation for Public Comment

This public comment relates to changes in FR 5112.

Auditoriums covered by article 518 may contain receptacles to service sound, lighting, and other presentation equipment that are not accessible to the general public. There is no reason to mandate tamper-resistant receptacles in auditorium areas that are not accessible to the general public.

In addition, though the current wording of 406.12(F) created by FR 5112 is limited to a "subset of assembly occupancies described in article 518.2", the wording of 406.12(F) has the potential to create a great deal of confusion. Theaters and similar locations covered by article 520 also include auditoriums that are the audience seating areas of theaters. Auditoriums in theaters contain numerous positions to service stage equipment that are not accessible to the general public. There is no reason to mandate tamper-resistant receptacles in auditorium areas that are not accessible to the general public, but the existing wording of 406.12(F) may result in the misapplication of these requirements to auditoriums in theaters.

Finally, the word "article" was deleted from this section because the reference is to a section, not an article.

Committee Statement

Committee Action: Rejected
Resolution: The utilization of TR receptacles is not limited to 'general public' areas but rather to any location. To limit TR receptacles to only general public access areas would reduce the potential safety afforded by these devices.
Public Comment No. 1133-NFPA 70-2015 [Section No. 406.12(G)]

(G) Dormitories.

All nonlocking-type, 15- and 20-ampere receptacles shall be listed tamper-resistant receptacles.

Exception to (A), (B), (C), (D), (E), (F), and (G): Receptacles in the following locations shall not be required to be tamper resistant:

1. Receptacles located more than 1.7 m (5 1/3 ft) above the floor
2. Receptacles that are part of a luminaire or appliance
3. A single receptacle or a duplex receptacle for two appliances located within the dedicated space for each appliance that, in normal use, is not easily moved from one place to another and that is cord-and plug-connected in accordance with 400.10(A)(6), (A)(7), or (A)(8)
4. Nongrounding receptacles used for replacements as permitted in 406.4(D)(2)(a)
5. Post Secondary Educational Facilities both public and private

Statement of Problem and Substantiation for Public Comment

It is a viable expectation that dormitories for private schools who serve children contain tamper proof receptacles, but post secondary facilities house adults who are fully capable of recognizing the dangers of attempting to place a foreign objects into an electrical receptacle.

Submittal Date: Wed Sep 23 21:24:42 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: The panel continues to extend the use of TR type receptacles in other locations that a child may occupy. Some college dormitories are dual classified as R1/R2 locations and used as summertime transient occupancy of children.
Public Comment No. 168-NFPA 70-2015 [ Section No. 408.3(A)(2) ]

(2) Service Panelboards, Switchboards, and Switchgear.

Barriers shall be placed in all service panelboards, switchboards, and switchgear such that no uninsulated, ungrounded service busbar or service terminal is exposed to inadvertent contact by persons or maintenance equipment while servicing load terminations.

Exception No. 1: This provision shall not apply to service panelboards with provisions for more than one service disconnect within a single enclosure as permitted in 408.36, Exceptions 1, 2, and 3.

Exception No. 2: This provision shall not apply to service rated transfer switches that do not contain an integral panelboard.

Exception No. 3: This provision shall not apply to an individual disconnecting means that is listed as suitable for use as service equipment.

Statement of Problem and Substantiation for Public Comment

Service rated transfer switches contain overcurrent protection for the service conductors, and the overcurrent protection device is generally a circuit breaker. The barrier requirements for service rated panelboards could be improperly enforced on these types of transfer switches, when these switches do not contain integral panelboards. Adding the exception of individual service disconnects again enforces the code language that the requirements are for main breaker panelboards that are installed as the electrical service, not an individual service disconnecting means that is installed upstream of a distribution subpanel. Changing "does not" to "shall not" in the first exception brings the language in line with the requirements of 90.5(A)

Submittal Date: Tue Jul 07 11:40:06 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-2410-NFPA 70-2015
Statement: The Panel has replaced the phrase "provision does" with the phrase "requirement shall" to be consistent with current code terminology. The proposed added Exceptions 2 & 3 in comment 168 contain language that is not subject to the provisions of 408.3(A)(2) and are therefore rejected, although the concerns of the submitter are met as the concepts included in the proposed exceptions are already excluded from the cited requirements.
(C) Used as Service Equipment.

Each switchboard, switchgear, or panelboard, if used as service equipment, shall be provided with a main bonding jumper sized in accordance with 250.28(D) or the equivalent placed within the panelboard or one of the sections of the switchboard or switchgear for connecting the grounded service conductor on its supply side to the switchboard, switchgear, or panelboard frame. All sections of a switchboard or switchgear shall be bonded together using a supply-side bonding jumper sized in accordance with 250.102 or 250.102(C)(1) as applicable.

Exception: Switchboards, switchgear, and panelboards used as service equipment on high-impedance grounded neutral systems in accordance with 250.36 shall not be required to be provided with a main bonding jumper.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that further consideration be given to the comments expressed in voting on FR 2425

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-2412-NFPA 70-2015
Statement: The terms "an equipment bonding jumper or" are added to reinstate previous language that was inadvertently removed during the First Draft process. The term "Jumper" is being inserted in place of the term "conductor" to correlate with terms commonly used and defined in Articles 100 and 250 of the NEC. The reference to 250.122 is the proper replacement for the incorrect reference to 250.102 regarding the previously mentioned omitted language.
Public Comment No. 264-NFPA 70-2015 [Section No. 408.3(C)]

(C) Used as Service Equipment.

Each switchboard, switchgear, or panelboard, if used as service equipment, shall be provided with a main bonding jumper sized in accordance with 250.28(D) or the equivalent placed within the panelboard or one of the sections of the switchboard or switchgear for connecting the grounded service conductor on its supply side to the switchboard, switchgear, or panelboard frame. All sections of a switchboard or switchgear shall be bonded together using an equipment bonding conductor or a supply-side bonding jumper sized in accordance with 250.102 or 250.102(C)(1) as applicable.

Exception: Switchboards, switchgear, and panelboards used as service equipment on high-impedance grounded neutral systems in accordance with 250.36 shall not be required to be provided with a main bonding jumper.

Statement of Problem and Substantiation for Public Comment

The original wording approved by CMP 9 is not contained in FR 2425. The mark-up above is based on the final wording that would result from the FR as written in the ballot. The above would correct to the wording in the ballot to the wording approved by CMP 9. The original wording approved by CMP 9 is as follows:

(C) Used as Service Equipment.

Each switchboard, switchgear, or panelboard, if used as service equipment, shall be provided with a main bonding jumper sized in accordance with 250.28(D) or the equivalent placed within the panelboard or one of the sections of the switchboard or switchgear for connecting the grounded service conductor on its supply side to the switchboard, switchgear, or panelboard frame. All sections of a switchboard or switchgear shall be bonded together using an equipment bonding conductor or supply-side bonding jumper sized in accordance with 250.122 or 250.102(C)(1) as applicable.

**Committee Statement**
- **Committee Action:** Rejected
- **Resolution:** Use of the terms "installed and torqued per the listing and installation requirements" does not provide a better understanding of the requirement. The current language is clear and used in at least two other locations in the NEC. CMP-9 also discussed the improper use of the term "per" and previous efforts to eliminate its use.
Public Comment No. 287-NFPA 70-2015 [Section No. 408.54]

408.54 Maximum Number of Overcurrent Devices.

A panelboard or switchboard shall be provided with physical means to prevent the installation of more overcurrent devices than that number for which the panelboard was designed, rated, and listed.

For the purposes of this section, a 2-pole circuit breaker or fusible switch shall be considered two overcurrent devices; a 3-pole circuit breaker or fusible switch shall be considered three overcurrent devices.

Statement of Problem and Substantiation for Public Comment

The resolution stated "Since switchboards are generally larger than panelboards this additional requirement is not necessary or practical as switchboards are judged on adequacy of wiring space not number of circuits."

My original substantiation cited the "six-main" rule. If a main-lug-only switchboard is used for service-entrance purposes, ref. 230.71, the maximum number of disconnects allowed is six. In that case, the switchboard will be manufactured to exclude more than six sets of fuses or circuit breakers the same as would a panelboard used for a like purpose. The volume of the switchboard has nothing to do with the requirement. The mandate of the NEC, section 230.71 does. The proposed change causes 408.54 to conform to 230.71.

Additionally, it causes the section to conform to Table 450.3(B), Note 2 "2. Where secondary overcurrent protection is required, the secondary overcurrent device shall be permitted to consist of not more than six circuit breakers or six sets of fuses grouped in one location. Where multiple overcurrent devices are utilized, the total of all the device ratings shall not exceed the allowed value of a single overcurrent device."

Committee Statement

Committee Action: Rejected
Resolution: Adding "or switchboards" at 408.54 is an inappropriate location for this proposed requirement and is not intended to address the 6 disconnect rule. Perhaps a better location for this proposed change would have been a new 408.23 in Part II of Article 408, which is titled, "Switchboards and Switchgear." Even if proposed for the appropriate location in Part II, the panel statement for PI 1580 is still applicable. Since switchboards are generally larger than panelboards this additional requirement is not necessary or practical as switchboards are judged on adequacy of wiring space not number of circuits. 230.71 addresses the maximum number of service disconnecting means and the product standards address the construction of the equipment as it leaves the factory.
Public Comment No. 1800-NFPA 70-2015 [Section No. 409.22]

409.22 Short-Circuit Current Rating.

An industrial control panel shall not be installed where the available fault current exceeds its short-circuit current rating as marked in accordance with 409.110(4).

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that this First Revision be reviewed by the panel with regard to similar text in 409.22. The panel shall consider reviewing the proper use of the terms “fault current” and “short circuit current”.

Submittal Date: Tue Sep 29 08:49:03 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3003-NFPA 70-2015
Statement: “Fault” current is replaced by “short-circuit” current for improved clarity. Throughout the NEC®, “fault” current can be replaced by “short-circuit” current, without changing the intent. However, “short-circuit” current cannot be universally changed to “fault” current without causing confusion. For example, equipment short-circuit current rating could not be changed to equipment fault current rating without causing much confusion. CMP 11 asks the Correlating Committee to direct all Code Making Panels to replace “fault” current with “short-circuit” current throughout the NEC®.

In order to further improve clarity surrounding “short-circuit” current versus “fault” current, 409.22 is combined with 409.23 as has been done in the new 440.10. The previous text in 409.22 now becomes first level subdivision (A), titled “Installation”, and the text in 409.23 becomes first level subdivision (B). The title of 409.23, “Available Fault Current”, is changed to “Documentation” as the new title of first level subdivision (B).
Public Comment No. 1033-NFPA 70-2015 [Section No. 409.23]

Available Fault Current

When an industrial control panel is required to be marked with a short circuit current rating in accordance with 409.110(4), the available short circuit current at the industrial control panel and the date the short circuit current calculation was performed shall be documented and made available to those authorized to inspect the installation.

Statement of Problem and Substantiation for Public Comment

While it is certainly important for industrial control panels to have an adequate short circuit current rating, this may be said for ALL electrical equipment. This is clearly covered in Sections 110.9 and 110.10. This requirement should be in Article 110 and not proliferated throughout the Code as it is a fundamental requirement that applies to all equipment.

Submittal Date: Wed Sep 23 10:22:08 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: The Panel reaffirms its position that documentation of the available short-circuit current and the date will increase safety. It will create safer installations by adding language to assist the installer and the Authority Having Jurisdiction (AHJ). Documentation with a date can actually reduce liability for contractors, inspectors, and manufacturers, by identifying that equipment was originally installed correctly. The extra emphasis is needed because the requirements are not being met, thereby causing issues with code compliance and inspection requirements.
Available Fault Current.

When an industrial control panel is required to be marked with a short circuit current rating in accordance with 409.110(4), the available short circuit fault current at the industrial control panel and the date the short circuit fault current calculation was performed shall be documented and made available to those authorized to inspect the installation.

**Statement of Problem and Substantiation for Public Comment**

The wording change is suggested for consistency with code language in sections 110.9, 440.10, etc and with this section's own title.

Statement of Problem and Substantiation for Public Comment

IEC's position is to delete 409.23 - (FR 3002)

The code already requires that equipment be installed according to available fault current, so adding this requirement is redundant. The installer/supplier already has the responsibility/liability to install the proper equipment based on the characteristics of the system. This proposal puts too much liability on the contractor/supplier because after installation various factors can change which will affect the available fault current. Feeders can be reworked, transformers can be changed with different impedance values, motor loads can be added to the existing system and similar factors that can change the available fault current. In the case of a lawsuit, the installer will have the burden of proof that the installation was done according to code and would result in unnecessary costs for defending an installation that was installed correctly, but that had variables change that are out of their control.

A better proposal would be to require the owner to relabel the equipment after any alteration to the system.

409.110 Marking.  

An industrial control panel shall be marked with the following information that is plainly visible after installation:

1. Manufacturer's name, trademark, or other descriptive marking by which the organization responsible for the product can be identified.

2. Supply voltage, number of phases, frequency, and full-load current for each incoming supply circuit.

3. Industrial control panels supplied by more than one electrical source such that more than one disconnecting means is required to disconnect all circuits within the control panel shall be marked to indicate that more than one disconnecting means is required to de-energize the equipment. The location of the means necessary to disconnect all circuits 50-volts and over shall be documented and available.

4. Short-circuit current rating of the industrial control panel based on one of the following:
   a. Short-circuit current rating of a listed and labeled assembly
   b. Short-circuit current rating established utilizing an approved method
      
      Informational Note: ANSI/UL 508A, Standard for Industrial Control Panels, Supplement SB, is an example of an approved method.
      
      Exception to (4): Short-circuit current rating markings are not required for industrial control panels containing only control circuit components.

5. If the industrial control panel is intended as service equipment, it shall be marked to identify it as being suitable for use as service equipment.

6. Electrical wiring diagram or the identification number of a separate electrical wiring diagram or a designation referenced in a separate wiring diagram.

7. An enclosure type number shall be marked on the industrial control panel enclosure.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that the phrase “50-volts and over” be changed to “50 volts or more” to correlate with other parts of the Code.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacturer remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

</table>
| Statement        | The Panel agrees with public comment clarifying certain equipment be “listed and labeled” instead of just “listed.” Qualified Electrical Testing Laboratories do not consider a product to be listed unless the label has actually been applied.  
Additionally, the Article 100 definition for “labeled” includes the provision for labeling the smallest unit carton for parts which are too small to include the listing mark on the parts themselves. Labeling includes listing marks that are stamped or molded on or into the product. |
**Public Comment No. 667-NFPA 70-2015 [ New Section after 410.30(A) ]**

**410.30(B) Locking Support and Mounting Receptacle and Attachment Fitting Combination.**

1. Locking support and mounting receptacle shall be listed and marked with the manufacturer's name or identification, and voltage and ampere rating.

2. Listed locking support and mounting receptacle in combination with recognized attachment fitting shall be permitted to support and supply ceiling- or wall-luminaires and ceiling-suspended luminaires.

3. Locking support and mounting receptacle and attachment fitting combinations shall be of the grounding-type and shall be connected to the equipment grounding conductors in accordance with 250.130(C).

4. Locking support and mounting receptacle and attachment fitting combinations used to connect and support ceiling-suspended (paddle) fans and luminaires shall only be permitted to be used with outlet boxes conforming to 314.27(E) installed as required by 314.23.

**Informational Note:** Locking support and mounting receptacles when used in conjunction with compatible attachment fitting are designed to connect, supply and support individual ceiling- or wall-mounted luminaires and ceiling-suspended (paddle) fans.

**Statement of Problem and Substantiation for Public Comment**

New text was proposed and approved for 314.27(E) by CMP 9 in FR 2411 that read as follows:

(E) Separable Attachment Fittings. Outlet boxes shall be permitted to support listed locking support and mounting receptacles used in combination with compatible attachment fittings designed for the support of equipment covered within and subject to all weight and orientation limits contemplated by the listing. Where such fittings are used, the equipment mounted shall comply with 314.27(A) through (D) as applicable. Where the supporting receptacle is installed within a box, it shall be included in the fill calculation covered in 314.16(B)(4).

This proposed new text in 410.30(B) is needed because it coordinates with the new 314.27(E), and should also be covered under the article on receptacles for clarity as it is a connection and disconnection means for luminaires.

**Related Item**

First Revision No. 2411-NFPA 70-2015 [Section No. 314.27]

Affiliation: Safety Quick Lighting and Fans Corp.
Street Address: 
City: 
State: 
Zip: 
Submittal Date: Tue Sep 15 15:41:52 EDT 2015

**Committee Statement**

Committee Action: Rejected
Resolution: Item (1) is specific to the listing of receptacles and is not appropriate for inclusion in Article 410. Article 406 already requires receptacles to be listed. The word “recognized” in item (2) refers to “UL recognized”. The “UL recognition” program is not acknowledged in the code. The item (4) reference to 314.27(E) is superfluous as 314.27 (E) stands on its own. The current text of section 410.30 is very general and only includes the minimum requirements for luminaire supports. There are numerous means of luminaire support that are not detailed in section 410.30. As mentioned during the Public Input phase, a new section in the code is not required since AHJ’s look for the certification mark to determine suitability of product for the installation along with other requirements. The Code does not preclude the use of a listed luminaire locking support and mounting receptacle and attachment fitting. As a listed product there is no prohibition for its installed use. The inclusion of this specific product in section 410.30, while other methods of mounting aren’t mentioned, may lead to an incorrect conclusion that it is a preferred method of mounting.
(D) Splices and Taps.

No unnecessary splices or taps shall be made within or on a luminaire. Splices or taps located in the interior of an enclosed
raceway, pole that is installed in an abovegrade wet location, including poles used to support luminaires, shall be listed for
damp or wet locations.

Informational Note: For approved means of making connections, see 110.14.

Statement of Problem and Substantiation for Public Comment

First Revision #5116 and Section 410.56(D) should be revised to remove the interior of an enclosed “raceway” since splicing is not
permitted in enclosed raceways without removable covers per 300.13(A) and 300.15(A). Section 300.9 states that the interior of a
raceway in a wet location is also a wet location. Therefore, the reference to “damp” is also removed.

Submittal Date: Thu Sep 10 09:13:08 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-5108-NFPA 70-2015 With the removal of “damp locations” from the revision, as suggested by Public Comment #595,
the entire revision is not needed since the requirement for wet location connectors is covered elsewhere in the code.
Connectors are not rated for damp locations.
Statement: First Revision #5116 anticipated the acceptance of Public Input #4367 to section 110.14(B) which would have created the
opportunity for “damp location” ratings to be defined in the product standards for connectors and splices. Since Public
Input #4367 was rejected and no subsequent comments were submitted regarding creating damp location requirements
for connectors, including them in 410.56(D) is not appropriate.
Public Comment No. 1639-NFPA 70-2015 [Section No. 410.62(C)]

(C) Electric-Discharge and LED Luminaires.

Electric-discharge and LED luminaires shall comply with (1), (2), and (3) as applicable.

(1) Cord-Connected Installation.

A luminaire or a listed assembly in compliance with any of the conditions in (a) through (c) shall be permitted to be cord connected provided all of the following conditions are met:

(1) The luminaire is located directly below the outlet or busway.
(2) The cord is not subject to strain or physical damage.
(3) The cord is visible over its entire length except at terminations.

   a. A luminaire shall be permitted to be connected with a cord terminating in a grounding-type attachment plug or busway plug.
   b. A luminaire assembly equipped with a strain relief and canopy shall be permitted to use a cord connection between the luminaire assembly and the canopy. The canopy shall be permitted to include a section of raceway not over 150 mm (6 in.) in length and intended to facilitate the connection to an outlet box mounted above a suspended ceiling.
   c. Listed luminaires connected using listed assemblies that incorporate manufactured wiring system connectors in accordance with 604.100(C) shall be permitted to be cord connected.

(2) Provided with Mogul-Base, Screw Shell Lampholders.

Electric-discharge luminaires provided with mogul-base, screw shell lampholders shall be permitted to be connected to branch circuits of 50 amperes or less by cords complying with 240.5. Receptacles and attachment plugs shall be permitted to be of a lower ampere rating than the branch circuit but not less than 125 percent of the luminaire full-load current.

(3) Equipped with Flanged Surface Inlet.

Electric-discharge luminaires equipped with a flanged surface inlet shall be permitted to be supplied by cord pendants equipped with cord connectors. Inlets and connectors shall be permitted to be of a lower ampere rating than the branch circuit but not less than 125 percent of the luminaire load current.

Statement of Problem and Substantiation for Public Comment

The numbering of this revision seems to be wrong (1,2,3 a,b,c, etc.).

Public Comment No. 469-NFPA 70-2015 [Section No. 410.62(C)(1)]

(1) Cord-Connected Installation.
A luminaire or a listed assembly in compliance with any of the conditions in (a) through (c) shall be permitted to be cord connected provided all of the following conditions are met:

1. The luminaire is located directly below the outlet or busway.
2. The cord is not subject to strain or physical damage.
3. The cord is visible over its entire length except at terminations.
4. A luminaire shall be permitted to be connected with a cord terminating in a grounding-type attachment plug or busway plug.
5. A luminaire assembly equipped with a strain relief and canopy shall be permitted to use a cord connection between the luminaire assembly and the canopy. The canopy shall be permitted to include a section of raceway not over 150 mm (6 in.) in length and intended to facilitate the connection to an outlet box mounted above a suspended ceiling.
6. Listed luminaires connected using listed assemblies that incorporate manufactured wiring system connectors in accordance with 604.100(C) shall be permitted to be cord connected.

Statement of Problem and Substantiation for Public Comment

I suggest a., b., and c. be changed to 4, 5, and 6. since a, b, an c have nothing to do with (3).

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-5109-NFPA 70-2015
Statement: Number and language revised to improve clarity.
(B) Combustible Low-Density Cellulose Fiberboard.

Where a surface-mounted luminaire containing a ballast, transformer, LED driver, or power supply is to be installed on combustible low-density cellulose fiberboard, it shall be marked for this condition or shall be spaced not less than 38 mm (1 ½ in.) from the surface of the fiberboard. Where such luminaires are partially or wholly recessed, the provisions of 410.110 through 410.122 shall apply.

Informational Note: Combustible low-density cellulose fiberboard includes sheets, panels, and tiles that have a density of 320 kg/m³ (20 lb/ft³) or less and that are formed of bonded plant fiber material but does not include solid or laminated wood or fiberboard that has a density in excess of 320 kg/m³ (20 lb/ft³) or is a material that has been integrally treated with fire-retarding chemicals to the degree that the flame spread index in any plane of the material will not exceed 25, determined in accordance with tests for surface burning characteristics of building materials. See ANSI/ASTM E84 UL 723-2014, Test Method for Test for Surface Burning Characteristics of Building Materials.

Statement of Problem and Substantiation for Public Comment

Every code cycle the panel updates the reference to ASTM 84 in the Informational Note with the latest revision date. When the panel met in January during the Public Input stage the reference was changed to “ANSI/ASTM E84-2014”. Since January ASTM E84 has been revised twice. The revision history for ASTM E84 shows that it has been revised 16 times since 2010. With this frequency of revisions, any revision mentioned in the code will more than likely be out of date as soon as the 2017 NEC is published.

While researching ASTM E84 I came upon a 10-year old UL White Paper that indicates that ASTM E84 and UL 723 are identical. Further research led to the guide-card information for UL category code BIKT which states, “The basic standard used to investigate building products for surface-burning characteristics is ANSI/UL 723, ‘Test for Surface Burning Characteristics of Building Materials.’ The same test method is also covered in ANSI/ASTM E84, ‘Standard Test Method for Surface Burning Characteristics of Building Materials.’ Where surface-burning characteristics are required, many model codes recognize either standard.”

Since ASTM E84 and UL 723 are the same I propose changing the reference in the Informational Note of 410.136(B) from ASTM E84 to UL 723 since UL 723 gets revised with less frequency than ASTM E84.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-5110-NFPA 70-2015
Statement: Updated ASTM standard to most recent edition. Added UL 723 as this standard is a mirror image of the ASTM standard.
411.3 Low-Voltage Lighting Systems.

Low voltage lighting systems operating at 30 volts or less shall consist of an isolating power supply, low-voltage luminaires, and associated equipment that are all identified for the use. The output circuits of the power supply shall be rated for 25 amperes maximum under all load conditions.

Statement of Problem and Substantiation for Public Comment

Removing the 30 volt restriction allows for a higher voltage and in my opinion takes it out of the traditional low voltage category. I also believe the power supplies this would add, like landscape lighting power sources, increase the available current from 100va to 300va and propose a safety hazard in these uses where exposed conductors are allowed.

Submittal Date: Fri Sep 25 15:01:33 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: The 30 volt limit remains for the AC systems but the 2014 NEC acknowledged that DC systems operating at 60 V or less provide for comparable levels of safety (these are identified in Tables 11(A) and (B), respectively, as the Class 2 voltage limits). Exposed conductor systems, which are addressed in 411.6(C), are permitted for indoor use only. Power levels (whether 100 VA or 300 VA) only correlate to a “safety hazard” when the associated wiring is not sized to accommodate the power level; this is precluded by the listing requirement of 411.4(A) and (B).
411.3 Low-Voltage Lighting Systems.

Low voltage lighting systems shall consist of an isolating, a listed Class 2 power supply, listed LPS power supply, low-voltage luminaires, and associated equipment that are all identified for the use. The output circuits of the power supply shall be rated for 25 amperes maximum under all load conditions.

Statement of Problem and Substantiation for Public Comment

Listed, Class 2 and LPS are safety issues that should not be deleted and would allow greater VA to be allowed when exposed conductors are permitted. Safety is paramount when exposed conductors are permitted and the number of power supplies should not be an issue.

Public Comment No. 1330-NFPA 70-2015 [ Sections 411.4(A), 411.4(B) ]

Sections 411.4(A), 411.4(B)

(A) Listed System.

The luminaires, power supply, and luminaire fittings (including the exposed bare conductors) of an exposed bare conductor lighting system shall be listed and labeled for the use as part of the same identified lighting system.

(B) Assembly of Listed Parts.

A lighting system assembled from the following listed and labeled parts shall be permitted:

1. Low-voltage luminaires
2. Power supply
3. Low-voltage luminaire fittings
4. Suitably rated cord, cable, conductors in conduit, or other fixed Chapter 3 wiring method for the secondary circuit

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company's name, trade name, trademark or other authorized identification should be considered as being covered by UL's Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Committee Statement

| Committee Action: Accepted                                               |
| Resolution: SR-5113-NFPA 70-2015                                        |
| Statement: The Panel agrees with public comment clarifying certain equipment be “listed and labeled” instead of just “listed.” Qualified Electrical Testing Laboratories do not consider a product to be listed unless the label has actually been applied. Additionally, the Article 100 definition for “labeled” includes the provision for labeling the smallest unit carton for parts which are too small to include the listing mark on the parts themselves. Labeling includes listing marks that are stamped or molded on or into the product. |
Public Comment No. 1619-NFPA 70-2015 [Section No. 411.4(B)]

(B) Assembly of Listed Parts or Classified Parts to form a complete assembly.

A lighting system assembled from the following listed parts or classified parts shall be permitted:

1. Low-voltage luminaires
2. Power Class 2 or LPS power supply
3. Low-voltage luminaire fittings
4. Suitably rated cord, cable, conductors in conduit, or other fixed Chapter 3 wiring method for the secondary circuit

Statement of Problem and Substantiation for Public Comment

I do not feel we can allow regular power sources in a low voltage section based on the safety of allowed exposed conductors. UL has added the word classified and since we are changing this complete section we should be able to add if appropriate.

Committee Statement

Committee Action: Rejected
Resolution: Cords are not listed for specific use with lighting systems. Cord ratings can be found in Article 400. Including the word "listed" is not necessary since the heading of the article is "assembly of listed parts".
Statement of Problem and Substantiation for Public Comment

PI 2898 was resolved and the Panel 2 statement indicated that they were not going to delete the section and they requested that “the NEC CC forward this PI to CMP17 for consideration.” That request to forward would not/does not move it to Panel 17’s jurisdiction. However, FR No. 349 did delete 210.8 and within the statement they request “the NEC CC forward this PI to CMP17” (although it is assumed that it should have read FR not PI).

Unfortunately, it does not appear that the correlating committee caught the requests of Panel 2 to forward this information to Panel 17. The BCDC does not want Panel 17 may create a SR to add the text/requirement to Article 422. BCDC requests that this text remain out of the NEC.

Submittal Date: Fri Sep 25 17:57:47 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: Panel accepts the referral of PI 2898-NFPA 70-2014 [Section No.210.8(D)] from Panel 2. However, it does not accept the substance of the public comment which is the text of 210.8(D) remain out of the NEC. Panel 17 first revision of 422.5 included dwelling unit dishwashers on the basis of the potential for personal hazards from specific equipment which could be associated with abnormal conditions in equipment related to intentional or unintentional physical abuse, harsh environment, or simply end of life (see Committee Statement for First Revision 4801).
422.2 Definition.

**Vending Machine.** Any self-service device that dispenses products or merchandise without the necessity of replenishing the device between each vending operation. In exchange for service, it is designed to require insertion of coin, paper currency, token, card, key, or receipt of payment by other means.

Statement of Problem and Substantiation for Public Comment

I would ask CMP-17 to reconsider the proposed deletion of the definition of a "Vending Machine." Without a proper definition of the device, due to the requirements of 422.5 (was 422.51), all kinds of things would be opened up for interpretation as to requiring GFCI protection that CMP-17 has already deemed in the past unnecessary for GFCI protection, such as a casino slot machine, ATM machines, hotel ice machines, etc. A hotel ice machine might need GFCI protection (that is another discussion for another day), due to its own shock hazards, not because an AHJ has deemed it to be a "vending machine." Contrary to what is stated in the Panel Statement for FR 4875, requiring all appliances to be listed DOES NOT eliminate the need for a definition of vending machine. It only opens up inconsistent interpretation and enforcement as to what constitutes a vending machine and what does not. A definition of a vending machine gives the AHJ a good solid starting point in enforcement of proposed 422.5(A)(7) requiring GFCI protection for "vending machines."

Please note that I have proposed to break up the long sentence that was the definition of "Vending Machine" from the 2014 NEC and add the phrase, "In exchange for service, it is designed..." in the proposed definition. This will again aid in enforcement of this requirement and interpretation of the rules pertaining to GFCI requirements for vending machines.

Street Address:
City:
State:
Zip:
Submittal Date: Fri Sep 18 16:27:07 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: There is a virtually identical definition of vending machines in the product safety standard (ANSI/UL 751). The proposed definition is therefore duplicative and its inclusion in Article 422 only serves to increase the risk of the Code and standard being misaligned.
**Public Comment No. 810-NFPA 70-2015 [Section No. 422.5]**

**422.5 Ground-Fault Circuit-Interrupter (GFCI) Protection for Personnel.**

**(A) General.** Appliances identified in **422.5(A)(1) through (7)** rated 250 volts or less and 60 amperes or less, single- or 3-phase, shall be provided with GFCI protection for personnel within the branch circuit or outlet. Multiple GFCI protective devices shall be permitted but shall not be required.

1. Automotive vacuum machines provided for public use
2. Boat hoists
3. Drinking water coolers
4. Dwelling unit dishwashers
5. High-pressure spray washing machines — cord-and-plug-connected
6. Tire inflation machines provided for public use
7. Vending machines

**(B) Type.**

The GFCI shall be readily accessible, listed, and located in one or more of the following locations:

- Within the branch circuit overcurrent device
- A device or outlet within the supply circuit
- An integral part of the attachment plug
- Within Appliances identified in 422.5(B)(1) and (2) rated 250 volts or less and 60 amperes or less, single- or 3-phase, shall be provided with GFCI protection for personnel as integral part of the attachment plug, within the supply cord not more than 300 mm (12 in.) from the attachment plug
- Factory-installed within the appliance. Multiple GFCI protective devices shall be permitted but shall not be required.

1. Cord- and plug-connected high pressure spray washing machines
2. Vending machines

**Statement of Problem and Substantiation for Public Comment**

The intent of CMP 17 to centralize all appliance GFCI requirements from 210.8 to Article 422 is justified. But there is something inherently wrong with the wording in FR 4801. Automotive vacuum machines, boat hoists, drinking water coolers, dishwashers and tire inflation machines are typically fastened in place. There is no UL standard that requires GFCI protection for the aforementioned appliances, therefore replacements may not be provided with GFCI protection, within the supply cord, the attachment plug or factory-installed within the appliance.

High-pressure spray washing machines and some vending machines are portable and generally are not fastened in place. The requirements of providing GFCI protection for personnel within the supply cord, the attachment plug or factory-installed within the appliance should remain as CMP 17 intended.

Public Comment No. 1047-NFPA 70-2015 [Section No. 422.5(A)]

(A) General.
Appliances identified in 422.5(A)(1) through (7) rated 250 volts or less and 60 amperes or less, single- or 3-phase, shall be provided with GFCI protection for personnel. Multiple GFCI protective devices shall be permitted but shall not be required.

1. Automotive vacuum machines provided for public use
2. Boat hoists
3. Drinking water coolers
4. Dwelling unit dishwashers
5. High-pressure spray washing machines — cord-and-plug-connected
6. Tire inflation machines provided for public use
7. Vending machines

Statement of Problem and Substantiation for Public Comment

GFCI protection for specific, non-cord and plugged appliances is a growing contentious issue in dwellings where the concern is addressing the quality of the appliance from the manufacturer. Why the need for dishwashers in approaching protection for end of life cycle problems when there are numerous devices purchased daily for use in the kitchen without GFCI protection being required. Shouldn't all of these appliances then be considered, as well as other appliances throughout the dwelling?

The Panel substantiation is troubling to say the least in that they decided the most convenient place for the cost of the protection. Their determination that the outlet protection is best weighed against the manufacturer to protect persons from problems cause by aging of the appliance cannot be explained to the Public. One of our responsibilities as Code creators is being able to produce Codes that are enforceable for buildings that are constructed. When the entities responsible for adoption of Codes asks questions regarding this particular provision there is no response that justifies where this burden is placed.

In addition, GFCI protection requirements that originated in dwellings in the early 1970's was to protect persons from leakage current, the Panel's substantiation was directed at fire protection. This is not the characteristic of GFCI devices.

Submittal Date: Wed Sep 23 11:36:10 EDT 2015

Committee Statement
Committee Action: Rejected
Resolution: Panel 17 first revision of 422.5 included dwelling unit dishwashers on the basis of the potential for personal hazards from specific equipment which could be associated with abnormal conditions in equipment related to intentional or unintentional physical abuse, harsh environment, or simply end of life (see Committee Statement for First Revision 4801). The product safety standard for dishwashers (UL STP 749) has considered that the exposure of the heating elements in dishwashing compounds, water, and thermal expansion can in rare cases lead to stress corrosion cracking (SCC) of the outer surface of the sheathed heating element. (It is believed) that the cracking of this outer sheath can lead to water penetration of the heating element and shortening of the life of the element in some cases. If this occurs, SCC can shorten the life-span of the heating element by allowing water to penetrate the sheath of the element. Water ingress into the insulating layer of the element can lead to a rupture or arcing failure.
Public Comment No. 1432-NFPA 70-2015 [Section No. 422.5(A)]

(A) General.
Appliances identified in 422.5(A)(1) through (7) rated 250 volts or less and 60 amperes or less, single- or 3-phase, shall be provided with GFCI protection for personnel. Multiple GFCI protective devices shall be permitted but shall not be required.
(1) Automotive vacuum machines provided for public use
(2) Boat hoists
(3) Drinking water coolers, unless double insulated
(4) Dwelling unit dishwashers
(5) High-pressure spray washing machines — cord-and-plug-connected
(6) Tire inflation machines provided for public use
(7) Vending machines

Statement of Problem and Substantiation for Public Comment
Drinking water coolers, unlike traditional water fountains, are often all plastic external construction and may or may not even be connected to plumbing. An alternate means of protection like double insulation should be allowed in lieu of GFCI protection, as is often the case with portable tools.

Committee Statement
Committee Action: Rejected
Resolution: Although double insulation is also allowed as an alternative for equipment grounding in many other applications (including portable tools), neither provides the enhanced personnel protection against shock which is the purpose of having GFCI for certain applications. In the specific case of drinking water coolers, double insulation may not afford protection in the event of wetting of live parts (a leak breaching the two layers of insulation).
Public Comment No. 854-NFPA 70-2015 [ Section No. 422.5(A) ]

(A) General.
Appliances identified in 422.5(A)(1) through (7) rated 250 volts or less and 60 amperes or less, single- or 3-phase, shall be provided with GFCI protection for personnel. Multiple GFCI protective devices shall be permitted but shall not be required.

1. Automotive vacuum machines provided for public use
2. Boat hoists
3. Drinking water coolers
4. Dwelling unit dishwashers
5. High-pressure spray washing machines — cord-and-plug-connected
6. Tire inflation machines provided for public use
7. Vending machines

Statement of Problem and Substantiation for Public Comment
The 2014 NEC addresses the hazard associated with boat hoists beginning with the outlet serving the boat hoist up to 240V in Section 210.8(C). Protection is not limited to just protecting the hoist. There can be cord and plug connected boat hoists. A hazard may exist when inserting or removing the plug from the receptacle, therefore the protection needs to be in the branch circuit. Since the protection needs to remain in the branch circuit the requirement in the NEC must remain in 210.8. 210.8(C) should not be moved to Article 422.

Committee Statement
Committee Action: Rejected
Resolution: There is no substantiation provided that there is an increased hazard where GFCI protection is located in the plug. The listings of portable GFCI's do not restrict their use and the product safety standard (ANSI/UL 943) has provision for "wet location" types and a required instruction: "For installation in wet locations, protect the GFCI receptacle with a weatherproof cover that will keep both the receptacle and any plugs dry."
422.6 Listing Required.
All appliances shall be listed.
DELETE THIS CLAUSE

Statement of Problem and Substantiation for Public Comment

AHAM response to 3026-NFPA 7-2014 New Section 422.6

Delete this clause. The members of AHAM understand and share the commenter's concern that application of the specific requirements in Art. 422 should be applied in the same way. However, using a universal mandated of "listing" of all appliances will not solve the issues presented and will likely cause more confusion.

In the complex world of utilization equipment, there are many different products under the term "appliance." Art. 422 contains specific requirements for certain equipment but not for most types. We appreciate the desire to have all appliances safety certified, but the voluntary system of safety certification of the US has achieved virtually 100% compliance. The challenges of mandating this are many.

The current definition of "appliance" in the NEC may work for the Code but this proposal would now require all Certification Organizations (CO) to comply with this definition for all products under specific standards. The premise of the maker of the proposal that this would bring greater clarity or uniformity is unfortunately not true.

There are many problems with the insertion of so simple a phrase.
1. The addition of this language could require that AHJ's take on the role of determining if a piece of utilization equipment is an "appliance" and if the appropriate standard has been used. The AHJ may not have the necessary information on the internal technology of the product, its functions or the usage to make this determination. Examples: is an instantaneous water heater an appliance? Is this still true on the sink? Is a portable fan that operates with C cell batteries an appliance? Is a vacuum cleaner that contains a rechargeable battery an appliance?
2. To require "listing" of a product also requires under the definitions found in NFPA 70, that the product be put onto a "list." This implies that this list would be used by an AHJ for purposes of determining if the product has been evaluated properly. However, each CO may not agree and the same products could be on different lists. This proposal will not solve this confusion.
3. Many appliances are new and may have requirements under multiple safety standards (example: gas range with electric broiler). The safety certification may not list all the safety standards used in the evaluation. How will the AHJ know whether the correct standards were used?
4. Many "appliances" function on low voltage systems either through an external power supply or battery charger. Frequently, only the conversion portion of the "appliance" is listed and not what some would consider is the "appliance." The proposal would create a conflict between the Code and the listing requirements. These low voltage "appliances" will not appear on any list accessible to the AHJ.
5. Short runs of sample products may be used to gauge consumer interest and may not be certified at the time they are used for marketing purposes. This code change will cause difficulty for companies trying to bring new products to the market quickly.
6. Marking, listing, and categories of products are governed by the certification rules of the CO, may not be in the safety standards and may not agree with the specific designations within Art. 422. Between CO's there is a great deal of variability with respect to when the product must be marked with its category or classification or even the term that is used in the marking or category of a list. This proposal will not bring uniformity to the process.
7. Manufacturers may use show samples that display the product but are not working samples. Under this determination, companies could spend huge sums of money having every sales sample evaluated, just because the code now says "all appliances" must be safety certified. Does this include a demonstration, non-functional dishwasher on display at a retailer with a light bulb inside? This proposal will not solve the problems alluded to in the description and will likely cause many others. This is not the right approach.

Committee Statement
Committee Rejected
| **Action:** |  |
| **Resolution:** | The public comment substantiation raises compelling reasons for qualifying the First Revision that “All appliances shall be listed.” However, the Panel does not agree to delete the 422.6 as is proposed. Instead, it has developed a Second Revision with the necessary qualifying details. See Committee Statement on Public Comment No. 1517. |
Public Comment No. 1517-NFPA 70-2015 [Section No. 422.6]

422.6 Listing Required.
All appliances that are specifically addressed in Article 422 shall be listed.

Statement of Problem and Substantiation for Public Comment

The proposal is based on concerns that an installer may not know what specific installation section to follow in Article 422 unless the appliance is listed and labeled. However, the term "appliance" is very broad, and the proposal could be interpreted as applying to appliances that have no special installation requirements, such as portable appliances. We therefore propose to narrow the application of the requirement to those appliances specifically addressed in Article 422 that require special installation requirements.

Committee Statement

Committee Action: Rejected
Resolution: The technical substantiation was provided in public input no. 3026-NFPA 70-214 and is repeated below. "...Listing of products will properly classify the equipment and that listing will ensure application of proper installation requirements. For example, the NEC definition of vending machine is very broad and likely includes equipment not listed as appliances and probably not considered in the development of requirements in 422.51. Additionally, Article 422 includes requirements that must be included in the construction of the equipment. Listing will obviously be the best place to address those requirements."
Public Comment No. 1250-NFPA 70-2015 [Section No. 422.15(A)]

(A)
Listed and labeled central vacuum outlet assemblies shall be permitted to be connected to a branch circuit in accordance with 210.23(A).

Additional Proposed Changes

Description: ETL Essential Guide to Product Testing & Certification 2014/2015 North American Edition. Please review document pages numbers 5, 8 and 10 to see that ETL has requirements similar to UL, that products that do not bear their certification (listed) mark are not considered by ETL as being listed.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL's Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Committee Statement

Committee Action: Accepted
Resolution: SR-4802-NFPA 70-2015
Statement: The Panel agrees with public comment clarifying certain equipment be “listed and labeled” instead of just “listed.” Listing agencies do not consider a product to be listed unless the label has actually been applied.
Public Comment No. 941-NFPA 70-2015 [Section No. 422.16(B)(1)]

(1) Electrically Operated In-Sink Waste Disposers.

Electrically operated in-sink waste disposers shall be permitted to be cord-and-plug-connected with a flexible cord identified as suitable in the installation instructions of the appliance manufacturer where all of the following conditions are met:

(1) The flexible cord shall be terminated with a grounding-type attachment plug.
    
    Exception: A listed in-sink waste disposer distinctly marked to identify it as protected by a system of double insulation,
    
    or its equivalent,
    
    shall not be required to be terminated with a grounding-type attachment plug.

(2) The length of the cord shall not be less than 450 mm (18 in.) and not over 900 mm (36 in.).

(3) Receptacles shall be located to protect against physical damage to the flexible cord.

(4) The receptacle shall be accessible.

Statement of Problem and Substantiation for Public Comment

In the context of a sink waste disposer, it is unclear in the exception what the equivalent to double insulation is. Since these appliances may either be protected by grounding or double insulation, the “or its equivalent” statement in the requirement could be deleted without affecting product design and to also avoid confusion.

Committee Statement

Committee Action: Accepted
Resolution: SR-4803-NFPA 70-2015
Statement: In the context of a sink waste disposer, it is unclear in the exception what the equivalent to double insulation is. Since these appliances may either be protected by grounding or double insulation, the “or its equivalent” statement in the requirement could be deleted without affecting product design and to also avoid confusion.
Built-in dishwashers and trash compactors shall be permitted to be cord-and-plug-connected with a flexible cord identified as suitable for the purpose in the installation instructions of the appliance manufacturer where all of the following conditions are met:

1. The flexible cord shall be terminated with a grounding-type attachment plug.  
   **Exception:** A listed dishwasher or trash compactor distinctly marked to identify it as protected by a system of double insulation, or its equivalent, shall not be required to be terminated with a grounding-type attachment plug.

2. For a trash compactor, the length of the cord shall be 0.9 m to 1.2 m (3 ft to 4 ft) measured from the face of the attachment plug to the plane of the rear of the appliance.

3. For a built-in dishwasher, the length of the cord shall be 0.9 m to 2.0 m (3 ft to 6.5 ft) measured from the face of the attachment plug to the plane of the rear of the appliance.

4. Receptacles shall be located to protect against physical damage to the flexible cord.

5. The receptacle for a trash compactor shall be located in the space occupied by the appliance or adjacent thereto.

6. The receptacle for a built-in dishwasher shall be located in the space adjacent to the space occupied by the dishwasher.

7. The receptacle shall be accessible.

Statement of Problem and Substantiation for Public Comment

I would ask CMP-17 to reconsider the proposed requirement that the receptacle for a built-in dishwasher be located only in the space adjacent to the space occupied by the dishwasher. If anything, I would ask CMP-17 to permit the receptacle outlet for a cord-and-plug dishwasher to ONLY be allowed to be in the same space occupied by the dishwasher. By requiring the receptacle outlet in the space adjacent to the dishwasher, this would typically constitute a hole drilled in the cabinet wall and the flexible cord required to pass through said drilled hole to the receptacle in the adjacent space. With the necessity to pull and push the dishwasher in and out of the dedicated space for the dishwasher (for maintenance and repair), this action would subject the flexible cord to the possibility of MORE physical damage than if the receptacle outlet were located behind the dishwasher in the same space. I suspect that most AHJs would look at the flexible cord ran through a drilled hole in a cabinet as a violation of 400.8(2) and 400.8(7).

The submitter of the Public Input that drove this proposed change indicated in his substantiation that UL 749 forbids electrical receptacles for dishwashers to be installed in the cabinet recess where the dishwasher is installed and requires the receptacle to be installed in a location adjacent to the dishwasher. The substantiation also indicated that the discontinuity between the product safety standard and the NEC needs to be corrected. While I agree with the last statement, perhaps the product standard needs to be changed rather than the NEC changed to allow more potential physical damage to the dishwasher flexible cord. The proposed new length of said cord is a needed change regardless of the location of the receptacle outlet.

<tbody>
<tr>
<td>Resolution:</td>
<td>The requirement of the product safety standard (ANSI/UL 749, clause 8.3.3a): “the power-supply receptacle for the appliance shall be installed in a cabinet or on a wall adjacent to the undercounter space in which the appliance is to be installed”) has been in effect for over a decade. Since its inception, all but the longest-lived dishwashers have been replaced by units supplied with this instruction. The installation described in the problem statement is not difficult, has been common practice long before the product safety standard made it a requirement, and has an advantage whereby the plug can be more easily disconnected in the adjacent space than by having to first remove the dishwasher.</td>
</tr>
</tbody>
</table>
(2) Built-in Dishwashers and Trash Compactors.

Built-in dishwashers and trash compactors shall be permitted to be cord-and-plug-connected with a flexible cord identified as suitable for the purpose in the installation instructions of the appliance manufacturer where all of the following conditions are met:

(1) The flexible cord shall be terminated with a grounding-type attachment plug.

\textit{Exception: A listed dishwasher or trash compactor distinctly marked to identify it as protected by a system of double insulation.}

\textit{or its equivalent,}

\textit{shall not be required to be terminated with a grounding-type attachment plug.}

(2) For a trash compactor, the length of the cord shall be 0.9 m to 1.2 m (3 ft to 4 ft) measured from the face of the attachment plug to the plane of the rear of the appliance.

(3) For a built-in dishwasher, the length of the cord shall be 0.9 m to 2.0 m (3 ft to 6.5 ft) measured from the face of the attachment plug to the plane of the rear of the appliance.

(4) Receptacles shall be located to protect against physical damage to the flexible cord.

(5) The receptacle for a trash compactor shall be located in the space occupied by the appliance or adjacent thereto.

(6) The receptacle for a built-in dishwasher shall be located in the space adjacent to the space occupied by the dishwasher.

(7) The receptacle shall be accessible.

\section*{Statement of Problem and Substantiation for Public Comment}

In the context of dishwashers or trash compactors, it is unclear in the exception what the equivalent to double insulation is. Since these appliances may either be protected by grounding or double insulation, the “or its equivalent” statement in the requirement could be deleted without affecting product design and to also avoid confusion.

422.18 Support of Ceiling-Suspended (Paddle) Fans.

Ceiling-suspended (paddle) fans shall be supported independently of an outlet box or by one of the following:

(a) listed outlet box or
(b) outlet box systems identified for the use and installed in accordance with 314.27(C)
(c) outlet box systems identified for use utilizing listed locking support and mounting receptacle used in combination with a listed device including a compatible factory installed attachment fitting designed for support and installed in accordance with 314.27(E).

Statement of Problem and Substantiation for Public Comment

The text was editorially modified to be a list, and only item (3) was added as new text. This proposed text is not considered “new material” because it is added to coordinate with new text in 314.27(E) proposed and approved by CMP 9 in FR 2411 that reads as follows:

(E) Separable Attachment Fittings. Outlet boxes shall be permitted to support listed locking support and mounting receptacles used in combination with compatible attachment fittings designed for the support of equipment covered within and subject to all weight and orientation limits contemplated by the listing. Where such fittings are used, the equipment mounted shall comply with 314.27(A) through (D) as applicable. Where the supporting receptacle is installed within a box, it shall be included in the fill calculation covered in 314.16(B)(4).

Additionally, the “list” format of options is more user friendly.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4806-NFPA 70-2015
Statement: The Panel agrees to adding reference to the listed device and compatible factory installed attachment fitting noting that this is predicated on Panel 9 retaining its complementary First Revision (the new 314.27(E)). Made editorial revisions for clarity.
422.33 Disconnection of Cord-and-Plug-Connected or Attachment Fitting-Connected Appliances.

(A) Separable Connector or an Attachment Plug (or Attachment Fitting) and Receptacle.

For cord-and-plug- (or attachment fitting), connected appliances, an accessible separable connector or an accessible plug (or attachment fitting) and receptacle combination shall be permitted to serve as the disconnecting means. Where the separable connector or plug (or attachment fitting) and receptacle combination are not accessible, cord-and-plug-connected or attachment fitting-and-plug-connected appliances shall be provided with disconnecting means in accordance with 422.31.

(B) Connection at the Rear Base of a Range.

For cord-and-plug-connected household electric ranges, an attachment plug and receptacle connection at the rear base of a range, accessible from the front by removal of a drawer, shall meet the intent of 422.33(A).

(C) Rating.

The rating of a receptacle or of a separable connector shall not be less than the rating of any appliance connected thereto. Exception: Demand factors authorized elsewhere in this Code shall be permitted to be applied to the rating of a receptacle or of a separable connector.

Statement of Problem and Substantiation for Public Comment

This proposed text is not considered “new material” because it is added to coordinate with new text in 314.27(E) proposed and approved by CMP 9 in FR 2411 that reads as follows:

(E) Separable Attachment Fittings. Outlet boxes shall be permitted to support listed locking support and mounting receptacles used in combination with compatible attachment fittings designed for the support of equipment covered within and subject to all weight and orientation limits contemplated by the listing. Where such fittings are used, the equipment mounted shall comply with 314.27(A) through (D) as applicable. Where the supporting receptacle is installed within a box, it shall be included in the fill calculation covered in 314.16(B) (4).

It should be noted that for user-friendliness purposes, the definition for “attachment fitting” was previously submitted as PI 4316, and is now resubmitted as a Public Comment in light of the newly added text in 314.27(E).

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacturer remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Submitter Information Verification
Committee Statement

Committee Action: Accepted
Resolution: SR-4808-NFPA 70-2015
Statement: The Panel agrees with public comment clarifying certain equipment be "listed and labeled" instead of just "listed." Listing agencies do not consider a product to be listed unless the label has actually been applied.
424.37 On Walls. When permitted by the manufacturer, listed and labelled heating cables shall be permitted to be installed on walls of bathrooms, tub or shower spaces. Cables shall be covered per the manufacturer’s instructions. Unless otherwise specified in the installation instructions, cables shall be spaced not less than 150 mm (6 in.) from the ceiling and not less than 50 mm (2 in.) from an adjacent wall. Cables shall not be installed within 200 mm (8 in.) of luminaires, outlets, or wall penetration. Where heating cables are installed in walls a warning label suitable for the environment shall be affixed to the surface indicating the presence of electric heating cables and that penetrations are not permitted.

Statement of Problem and Substantiation for Public Comment

NEW Substantiation: Some heating cables are now specifically designed to be installed in the walls of indoor damp locations to facilitate the evaporation of excessive moisture on wall surfaces. This also inhibits the formation of damp conditions favorable for mold and fungus growth in wall cavities. Listed cables installed on walls under ceramic or stone tile will be protected from physical damage.

Committee Statement

Committee Action: Rejected
Resolution: Allowing the installation of heating cables on walls of tubs, showers and bathrooms would expose the user to the heating cables in a wet environment. If the intent of the submitter was to allow the heating cables to be installed in the walls or under the wall covering of tubs, showers and bathrooms this would still present an installation that modifications could be made to the walls of those areas presenting an unsafe condition for the user. Simply adding a statement that requires a warning label to be installed suitable for the environment would not provide a safe environment for the user. The label would likely be distracting to the user and the user would remove the label leaving a condition in which the presence of heating cables would not be known.

Committee Statement

Committee Action: Rejected
Resolution: Allowing the installation of heating cables on walls of tubs, showers and bathrooms would expose the user to the heating cables in a wet environment. If the intent of the submitter was to allow the heating cables to be installed in the walls or under the wall covering of tubs, showers and bathrooms this would still present an installation that modifications could be made to the walls of those areas presenting an unsafe condition for the user. Simply adding a statement that requires a warning label to be installed suitable for the environment would not provide a safe environment for the user. The label would likely be distracting to the user and the user would remove the label leaving a condition in which the presence of heating cables would not be known.
424.38 Area Restrictions.

(A) Extending Beyond the Room or Area.
Heating cables shall be permitted to extend beyond the room or area in which they originate.

(B) Uses Not Permitted.
Heating cables shall not be installed as follows:

1. In closets, other than as noted in 424.38(C) 424.38(D)
2. Over the top of walls where the wall intersects the ceiling
3. Over partitions that extend to the ceiling, unless they are isolated single runs of embedded cable
4. Under or through walls
5. Over cabinets whose clearance from the ceiling is less than the minimum horizontal dimension of the cabinet to the nearest cabinet edge that is open to the room or area
6. In tub and shower walls
7. Under cabinets or similar built-ins having no clearance to the floor

(C) In Closet Ceilings as Low-Temperature Heat Sources to Control Relative Humidity.
The provisions of 424.38(B) shall not prevent the use of cable in closet ceilings as low-temperature heat sources to control relative humidity, provided they are used only in those portions of the ceiling that are unobstructed to the floor by shelves or other permanent luminaires.

(D) Heating panels and heating panel sets shall be permitted in ceilings and floors of clothes closets when installed outside the closet storage space as defined in 410.2 and provided with independent temperature control.

Statement of Problem and Substantiation for Public Comment

The popularity of in-floor heating products has triggered the desire for warmed flooring in larger, walk-in type closets. Installing the cable only in the walkway would provide the necessary comfort without any fire risk. Using the existing definition of closet storage space from Article 410 and installing a control as specified in Canadian code would eliminate any safety concerns.

We believe we should incorporate the following recommendation according to the Canadian Electrical Code: Rule 62-212 Article 6: Heating Panels and Heating Panels Sets shall be permitted in ceilings and below floors of clothes closets if they are provided with independent temperature control.

Submittal Date: Fri Sep 25 15:12:01 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: This submission does not provide sufficient substantiation that would support that the area defined in 410.2 or the area outside of the definition in 410.2 would not be used as long term storage shielding entrapped heat. The submission lacks information on how to install an independent temperature control so as to avoid the entrapped heat hazard.
424.39 Clearance from Other Objects and Openings.

Heating elements of cables installed in ceilings shall be separated at least 200 mm (8 in.) from the edge of outlet boxes and junction boxes that are to be used for mounting surface luminaires. A clearance of not less than 50 mm (2 in.) shall be provided from recessed luminaires and their trims, ventilating openings, and other such openings in room surfaces. No heating cable shall be covered by any surface-mounted equipment.

Statement of Problem and Substantiation for Public Comment

As amended in the First Revision, the requirement no longer distinguishes between the heating and non-heating conductors of heating cables. The non-heating conductors are unnecessarily being required to be separated 8 in. from surface luminaire outlet and junction boxes and 2 in from recessed luminaires, their trim and ventilating openings. Such conductors are arguably no different from other current carrying conductors that are not similarly restricted in their location.

Committee Statement

Committee Action: Accepted
Resolution: SR-4809-NFPA 70-2015

Public Comment No. 1805-NFPA 70-2015 [Section No. 424.66(B)]

(B) Limited Access.

Where the enclosure is located in a space above a ceiling, all of the following shall apply:

(1) The enclosure shall be accessible through a lay-in type ceiling or an access panel(s).
(2) The width of the working space shall be the width of the enclosure or a minimum of 762 mm (30 in.), whichever is greater.
(3) All doors or hinged panels shall open to at least 90 degrees.
(4) The space in front of the enclosure shall comply with the depth requirements of Table 110.26(A)(1).
   a. A horizontal ceiling T-bar shall be permitted in this space.
   b. The work space shall be otherwise unobstructed to the floor

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that Public Input 1066 be referred to Code-Making Panel 17 for action due to the creation of First Revision 15 by CMP-1 on 110.26(A)(4).

Committee Action: Rejected but see related SR
Resolution: SR-4810-NFPA 70-2015
Statement: As currently written this section would prohibit the occupant of the building from installing movable items such as tables or desks in the space beneath the ceiling. Also revised text for clarification.

The Panel would like CMP-1 to address the revisions to this requirement.
Public Comment No. 1623-NFPA 70-2015 [Section No. 424.92(D)]

(D) Labels Provided by Manufacturer.

The manufacturers of heating panels or heating panel sets shall provide marking labels that indicate that the space-heating installation incorporates heating panels or heating panel sets and instructions that the labels shall be affixed to the panelboards to identify which branch circuits supply the circuits to those space-heating installations. If the heating panels and heating panel set installations are visible and distinguishable after installation, the labels shall not be required to be provided and affixed to the panelboards.

Statement of Problem and Substantiation for Public Comment

There are several reasons the panel should reconsider and accept this change. First, the rule is redundant. As the panel stated in the resolution to PI 3514 circuit identification is already adequately addressed by 408.4(A) which requires all circuits and circuit modifications to be marked at the panelboard by a suitable method determined by the installer and accepted by an AHJ. Second, this requirement is vague and unenforceable. There is no direction as to the size, shape, color or placement of the label, just that the label be affixed to the panelboard and identify the branch circuit(s). Third, it is discriminatory. The manufacturer-supplied label rule only applies to heating panels and heating panel sets but not to heating cables.

Committee Statement

Committee Action: Accepted
Resolution: SR-4811-NFPA 70-2015
Statement: Circuit identification is already adequately addressed by 408.4(A) which requires all circuits and circuit modifications to be marked at the panelboard by a suitable method determined by the installer and accepted by an AHJ. There is no direction as to the size, shape, color or placement of the label, just that the label be affixed to the panelboard and identify the branch circuit(s). The manufacturer-supplied label rule only applies to heating panels and heating panel sets but not to heating cables. The electrician can provide a more complete description of the location of the heating panel.
Sections 424.99(B)(5), 424.99(B)(6)

(5) — Fault Protection.
A device to open all ungrounded conductors supplying the heating panels or heating panel sets, provided by the manufacturer, shall function when a low- or high-resistance line-to-line, line-to-grounded conductor, or line-to-ground fault occurs, such as the result of a penetration of the element or element assembly.

(6) — Grounding Braid or Sheath.
Excluding nonheating leads, grounding means, such as copper braid, metal sheath, or other approved means, shall be provided with or as integral part of the heating panel or heating panel set.

When required by the manufacturer’s instructions, additional fault protection shall be installed.

Statement of Problem and Substantiation for Public Comment

Heating panels and panel sets, when suitable for installation under floor coverings, are required to be listed for this purpose. When grounded no additional safety device is needed.

In most cases, installation of a Fault Detecting Device (such as GFCI, ALCI, RCD), in an ungrounded circuit, provides adequate protection against risk of shock, and is most commonly the only protective device installed, aside from the branch circuit overcurrent device required by other sections of the code.

FPN a class 1 GFCI will trend to trip due to other phenomena such as natural leakage, capacitance etc. Therefore, the requirements are being simplified to be clear that a GFCI shall be provided in all cases and an easement on the grounding.. For specific products, if required by the listing and manufacturer’s instructions, additional fault protection may be required. When this is the case, this shall be installed and enforced by the AHJ. Therefore, item (5) is being modified to be clear for this requirement also.

Committee Statement

Committee Action: Rejected
Resolution: The Panel has reviewed the committee comments and will maintain First Draft text.
Public Comment No. 422-NFPA 70-2015 [Section No. 425.1]

425.1 Scope.
This article covers fixed industrial process heating employing electric resistance or electrode heating technology. For the purpose of this article, heating equipment shall include boilers, electrode boilers, duct heaters, strip heaters, immersion heaters, process air heaters, or other approved fixed electric equipment used for industrial process heating. This article shall not apply to heating and room air conditioning for personnel spaces covered by Article 424, fixed heating equipment for pipelines and vessels covered by Article 427, and induction and dielectric heating equipment covered by Article 665, or specialty industrial furnaces incorporating silicon carbide, molybdenum, or graphite process heating elements.

Statement of Problem and Substantiation for Public Comment

While I applaud the efforts for the introduction of this new article the scope could be construed by AHJ's to be applied to all industrial heating applications.

There are many specialized industrial heating applications such as Vacuum Furnaces and Atmospheric Furnaces that use graphite (and others) heating element systems. Industrial heating applications can be much more complex than this article has addressed.

I have been involved in some installations that are 89 KW and 289 KW rated heating elements. The latter system was a dual three-phase heating element system operating at 90 volts and 4,000 amperes controlled by a SCR controlled transformer. These are custom designed and cannot comply with many of the requirements of this section, particularly the limit of 48 ampere heating elements which cannot be generically applied to these industrial heating systems. I refer the committee to www.spangpower.com for information on the specialized transformers and controllers that are used for these applications. At this time the scope of this article needs to exclude these applications.

I have attempted to provide appropriate wording for these applications, but the committee may find better language to exempt these large industrial heating applications until they can find ways to address them suitably.

Resolution: SR-4813-NFPA 70-2015
Statement: The Panel has been informed there is technical complexity to these heating elements not currently being recognized by overcurrent protection requirements in Article 425.

Relevant NFPA standards that this article may apply to: NFPA 86, Standard for Ovens and Furnaces; NFPA 79 Electrical Standard for Industrial Machinery.
426.28 Ground-Fault Protection of Equipment

Ground-fault protection shall be provided for fixed outdoor electric deicing and snow-melting equipment.

Statement of Problem and Substantiation for Public Comment

Panel statement was that GFCI was allowed for the required protection. If so the reference to GFP should be more generalized and not stated as GFPE which is defined in our definitions. This change would also make the exception for GFCI in 210.8 B (3) understandable.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

**Committee Statement**

| Committee Action: | Rejected |
| Resolution: | Adjustable speed drive systems are a combination of an adjustable speed drive, its associated motor(s), and auxiliary equipment. As such this material is already covered properly in article 430. Recommended additional text does not improve clarity. Note that the scope is the responsibility of the correlating committee. |
(G) Conduits for Small Motors.

Conduits for small motors shall not be smaller than 14 AWG unless otherwise permitted in 430.22(G)(1) or (G)(2).

(1) 18 AWG Copper.

Where, 18 AWG individual copper conductors, installed in a cabinet or enclosure, 18 AWG individual copper conductors, copper conductors, that are part of a jacketed multiconductor cable assembly, or copper conductors in a flexible cord shall be permitted, under either of the following sets of conditions:

(1) The circuit supplies a motor with a full-load current rating, as determined by 430.6(A)(1), of greater than 3.5 amperes, and less than or equal to 5 amperes, and all the following conditions are met:
   (2) The circuit is protected in accordance with 430.52.
   (3) The circuit is provided with maximum Class 10 or Class 10A overload protection in accordance with 430.32.
   (4) Overcurrent protection is provided in accordance with 240.4(D)(1)(2).

(5) The circuit supplies a motor with a full-load current rating, as determined by 430.6(A)(1), of 3.5 amperes or less, and all the following conditions are met:
   (6) The circuit is protected in accordance with 430.52.
   (7) The circuit is provided with maximum Class 20 overload protection in accordance with 430.32.
   (8) Overcurrent protection is provided in accordance with 240.4(D)(1)(2).

(2) 16 AWG Copper.

Where, 16 AWG individual copper conductors, installed in a cabinet or enclosure, 16 AWG individual copper conductors, copper conductors, that are part of a jacketed multiconductor cable assembly, or copper conductors in a flexible cord shall be permitted under either of the following sets of conditions:

(1) The circuit supplies a motor with a full-load current rating, as determined by 430.6(A)(1), of greater than 5.5 amperes, and less than or equal to 8 amperes, and all the following conditions are met:
   (2) The circuit is protected in accordance with 430.52.
   (3) The circuit is provided with maximum Class 10 or Class 10A overload protection in accordance with 430.32.
   (4) Overcurrent protection is provided in accordance with 240.4(D)(2)(2).

(5) The circuit supplies a motor with a full-load current rating, as determined by 430.6(A)(1), of 5.5 amperes or less, and all the following conditions are met:
   (6) The circuit is protected in accordance with 430.52.
   (7) The circuit is provided with maximum Class 20 overload protection in accordance with 430.32.
   (8) Overcurrent protection is provided in accordance with 240.4(D)(2)(2).

Statement of Problem and Substantiation for Public Comment

No change to the other items of the sublisting.

The proposed text is identical to Public Input No. 1357 which should have been accepted as a First Revision to allow multiconductor cables and cords to leave the enclosure. The installation concerns expressed in the Code panel comment regarding potential damage to multiconductor cables and cords leaving the enclosure are adequately addressed in the construction specifications, wiring methods, and restrictions in Chapters 3 and 4.

**TITLE OF NEW CONTENT**
Type your content here ... Exception #2
Installation may comply with 240.21 (B) (5)

**Statement of Problem and Substantiation for Public Comment**

An outdoor feeder tap can be of unlimited length if it complies with all of the conditions of 240.21(B)(5) unless it is a motor short circuit and ground fault protective device as in 430.28. If the motor short circuit and ground fault protective device was in a panel containing a main it would be OK. It should be Acceptable to supply a Motor circuit with a tap conductor governed by the rules of 240.21(B)(5) when it feeds a motor short circuit and ground fault protective device.

Submittal Date: Tue Sep 29 09:29:23 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: “Fault” current is replaced by “short-circuit” current for improved clarity. Throughout the NEC®, “fault” current can be replaced by “short-circuit” current, without changing the intent. However, “short-circuit” current cannot be universally changed to “fault” current without causing confusion. For example, equipment short-circuit current rating could not be changed to equipment fault current rating without causing much confusion. CMP 11 asks the Correlating Committee to direct all Code Making Panels to replace “fault” current with “short-circuit” current throughout the NEC®.
Public Comment No. 1037-NFPA 70-2015 [Section No. 430.99]

The available short circuit current at the motor control center and the date the short circuit current calculation was performed shall be documented and made available to those authorized to inspect the installation.

Statement of Problem and Substantiation for Public Comment

While it is certainly important for motor control centers to have an adequate short circuit current rating, this may be said for ALL electrical equipment. This is clearly covered in Sections 110.9 and 110.10. This requirement should be in Article 110 and not proliferated throughout the Code as it is a fundamental requirement that applies to all equipment.

Submittal Date: Wed Sep 23 10:31:17 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: Proper installation according to the equipment short circuit current rating and documentation of the available short-circuit current and the date will increase safety. It will create safer installations by adding language to assist the installer and the Authority Having Jurisdiction (AHJ). Documentation with a date can actually reduce liability for contractors, inspectors, and manufacturers, by identifying that equipment was originally installed correctly. The extra emphasis is needed because the requirements are not being met, thereby causing issues with code compliance and inspection requirements.
430.99 Available Fault Current.
The available short-circuit fault current at the motor control center and the date the short-circuit fault current calculation was performed shall be documented and made available to those authorized to inspect the installation.

Statement of Problem and Substantiation for Public Comment
The wording change is suggested for consistency with code language in sections 110.9, 440.10, etc and with this section's own title.

CMP 11 asks the Correlating Committee to direct all Code Making Panels to replace “fault” current with “short-circuit” current throughout the NEC®.
430.99 - Available Fault Current

The available short circuit current at the motor control center and the date the short circuit current calculation was performed shall be documented and made available to those authorized to inspect the installation.

Statement of Problem and Substantiation for Public Comment

IEC's position is to delete 430.99 - (FR 3016)

The code already requires that equipment be installed according to available fault current, so adding this requirement is redundant. The installer/supplier already has the responsibility/liability to install the proper equipment based on the characteristics of the system. This proposal puts too much liability on the contractor/supplier because after installation various factors can change which will affect the available fault current. Feeders can be reworked, transformers can be changed with different impedance values, motor loads can be added to the existing system and similar factors that can change the available fault current. In the case of a lawsuit, the installer will have the burden of proof that the installation was done according to code and would result in unnecessary costs for defending an installation that was installed correctly, but that had variables change that are out of their control. A better proposal would be to require the owner to relabel the equipment after any alteration to the system.

Public Comment No. 668-NFPA 70-2015 [Section No. 430.109(F)]

(F) Cord-and-Plug- or Attachment Fitting- Connected Motors.

For a cord-and-plug-connected motor, an attachment fitting-connected motor, a horsepower-rated attachment plug and receptacle, flanged surface inlet and cord connector, attachment fitting having ratings no less than the motor, or attachment plug and cord connector having ratings no less than the motor ratings shall be permitted to serve as the disconnecting means. Horsepower-rated attachment plugs or attachment fittings, flanged surface inlets, receptacles, or cord connectors shall not be required for cord-and-plug-connected appliances in accordance with 422.33, room air conditioners in accordance with 440.63, ceiling-suspended (paddle) fans in accordance with 314.27(E), or portable motors rated \( \frac{1}{3} \) hp or less.

Statement of Problem and Substantiation for Public Comment

New text was proposed and approved for 314.27(E) by CMP 9 in FR 2411 that read as follows:

(E) Separable Attachment Fittings. Outlet boxes shall be permitted to support listed locking support and mounting receptacles used in combination with compatible attachment fittings designed for the support of equipment covered within and subject to all weight and orientation limits contemplated by the listing. Where such fittings are used, the equipment mounted shall comply with 314.27(A) through (D) as applicable. Where the supporting receptacle is installed within a box, it shall be included in the fill calculation covered in 314.16(B)(4).

The text needs to be modified in 430.109(F) to assure that an attachment fitting and receptacle combination that is load-make-and-load-break rated is recognized as a suitable disconnecting means for ceiling-suspended (paddle) fan motors.

Committee Action: Rejected but see related SR
Resolution: SR-3005-NFPA 70-2015
Statement: Reject but see SR3003 which complies with the direction of the Correlating Committee. “Fault” current is replaced by “short-circuit” current for improved clarity. Throughout the NEC®, “fault” current can be replaced by “short-circuit” current, without changing the intent. However, “short-circuit” current cannot be universally changed to “fault” current without causing confusion. For example, equipment short-circuit current rating could not be changed to equipment fault current rating without causing much confusion, CMP 11 asks the Correlating Committee to direct all Code Making Panels to replace “fault” current with “short-circuit” current throughout the NEC®.
440.9  .  Grounding and Bonding.
Where multimotor and combination-load equipment is installed outdoors on a roof, an equipment grounding conductor of the wire type shall be installed in outdoor portions of metallic raceway systems that use non-threaded fittings.

Statement of Problem and Substantiation for Public Comment

We agree with the negative comments submitted by the UL representative that “all UL certified metallic conduit, including EMT, is evaluated for its ability to bond the conduit to the connecting fittings” and that the requirement for additional grounding and bonding is a belts and suspenders approach that will not solve the issue of poor workmanship or ineffective maintenance practices. The Panel Statement that the use of non-threaded conduit systems on rooftops supplying HVACR equipment are subject to movement and damage “that results in separation of non-threaded conduit or tubing resulting in loss of equipment grounding unless a wire type equipment ground is provided” is far-reaching and inaccurate. Not all installations are subjected to the same conditions. A properly installed, code-compliant and properly maintained system will take into account code requirements for protection against physical damage, use of expansion fittings, good workmanship, etc. The installation of a supplemental grounding conductor is not a panacea for not following current code requirements.

Organization: NEMA
Street Address:
City:
State:
Zip:
Submittal Date: Mon Sep 21 11:37:08 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: The Panel reaffirms its position that the addition of a wire type equipment grounding conductor improves safety, by increasing the reliability of the equipment grounding conductor path.
440.10. Short-Circuit Current Rating.
(A) Installation.
Motor controllers of multimotor and combination load equipment shall not be installed where the available fault current exceeds its short-circuit current rating as marked in accordance with 440.4(R).
(B) Documentation.
When motor controllers or industrial control panels of multimotor and combination load equipment are required to be marked with a short circuit current rating, the available short circuit current and the date the short circuit current calculation was performed shall be documented and made available to those authorized to inspect the installation.

Statement of Problem and Substantiation for Public Comment

While it is certainly important for air conditioning and refrigerating equipment to have an adequate short circuit current rating, this may be said for ALL electrical equipment. This is clearly stated in Section 110.10. If this new section is added to the Code, it is likely that similar sections will be proposed to be added to numerous other articles. This requirement should be in Article 110 and not proliferated throughout the Code as it is a fundamental requirement that applies to all equipment. If AHJs are having difficulty determining whether or not HVAC equipment is properly rated, then they must be having the same difficulty for other equipment as well. That is the type of situation Article 110 is intended to address. The correlating committee may wish to review this language for consistency with other electrical equipment articles throughout the NEC.

### Statement of Problem and Substantiation for Public Comment

It was not the intent of the Public Input submitted to require the rating of the branch-circuit short-circuit and ground-fault protective device to be set at the maximum level stated on the Manufacturer's nameplate labels, as was suggested in the Panel's substantiation. Certainly smaller rated devices may start motor-compressors without damage, however, it has become increasingly the habit to install the smallest device possible. This leaves the decision as to what that minimum level permitted to carry the starting load of the equipment should be, after installation, up to the discretion of the Authority Having Jurisdiction. The minimum setting required by 440.12(A)(1) is not 175% as is generally the marked rating on the Manufacturer's nameplate.

### Related Item

Public Input No. 2724-NFPA 70-2014 [Section No. 440.22(A)]

### Submitter Information Verification

- **Organization:** North Carolina Code Clearing Committee
- **Street Address:**
- **City:**
- **State:**
- **Zip:**
- **Submittal Date:** Wed Sep 23 15:32:11 EDT 2015

### Committee Statement

- **Committee Action:** Rejected
- **Resolution:** The substantiation does not clearly indicate the problems encountered in the field. The branch-circuit, short-circuit, and ground fault protective device can be no smaller than the "minimum circuit ampacity" and no larger than the "maximum overcurrent protective device amperes" as marked on the nameplate.
The equipment branch-circuit short-circuit and ground-fault protective device shall be capable of carrying the starting current of the equipment with a minimum rating of 115% of the full-load current, or in accordance with 440.12(A)(1). Where the hermetic refrigerant motor-compressor is the only load on the circuit, the protection shall comply with 440.22(A). Where the equipment incorporates more than one hermetic refrigerant motor-compressor or a hermetic refrigerant motor-compressor and other motors or other loads, the equipment short-circuit and ground-fault protection shall comply with 430.53 and 440.22(B)(1) and (B)(2).

Statement of Problem and Substantiation for Public Comment

It was not the intent of the Public Input submitted to require the rating of the branch-circuit short-circuit and ground fault protective device to be set at the maximum level stated on the Manufacturer's nameplate labels, as was suggested in the Panel's substantiation. Certainly smaller rated devices may start motor-compressors without damage, however, it has become increasingly the habit to install the smallest device possible. This leaves the decision as to what that minimum level permitted to carry the starting load of the equipment should be, after installation, up to the discretion of the Authority Having Jurisdiction. The minimum setting required by 440.12(A)(1) is not 175% as is generally the marked rating on the Manufacturer's nameplate.

Committee Statement

Committee Action: Rejected
Resolution: The substantiation does not clearly indicate the problems encountered in the field. The branch-circuit, short-circuit, and ground fault protective device can be no smaller than the "minimum circuit ampacity" and no larger than the "maximum overcurrent protective device amps" as marked on the nameplate.

Resolution: Not all generators are listed and there are specialized generators for which listing would not be available.
445.10 Location.
Generators shall be of a type suitable for the locations in which they are installed. They shall also meet the requirements for motors in 430.14 and shall be installed so that they can be adequately maintained and serviced.

Informational Note: See NFPA 37, Standard for the Installation and Use of Stationary Combustion Engines and Gas Turbines, for information on the location of generator exhaust.

Statement of Problem and Substantiation for Public Comment
Referring the reader back to a paragraph that effectively just says “install it correctly and make sure you can also maintain it properly” seems like a waste of the user’s time—especially when it refers only to motors, which is confusing to a person not familiar with the NEC or the similarities between motors and generators. References to other sections should be limited to situations not only where there are common requirements that need to be coordinated and space savings are achieved. It should also be noted that perhaps even my words are extraneous, given that article 100 has many references to the need for proper installation requirements and maintenance.

Submittal Date: Wed Jul 15 19:15:04 EDT 2015

Committee Statement
Committee Action: Rejected
Resolution: The panel maintains that the reference to Section 430.14 should not be deleted since it provides important information that the generator install-er should be aware of with regards to ventilation and maintenance.
445.11 Marking.

Each generator shall be provided with a nameplate giving the manufacturer’s name, the rated frequency, the number of phases if of ac, the rating in kilowatts or kilovolt-amperes, the power factor, the normal volts and amperes corresponding to the rating, and the rated ambient temperature. ac, and the rated temperature rise.

Nameplates for all stationary generators and portable generators rated more than 15 kW shall also give the power factor, the insulation system class, and if field configurable, the subtransient and transient reactances, the maximum short-circuit current, and the insulation system class. Stationary and portable generators shall be marked to indicate if the generator is protected against overload by inherent design, an overcurrent protective relay, circuit breaker, or fuse.

Marking shall be provided by the manufacturer to indicate whether or not the generator neutral is bonded to its frame. Where the bonding is modified in the field, additional marking shall be required to indicate whether the neutral is bonded to the frame.

Exception: For inverter-based generators, the maximum short circuit current shall be marked on the nameplate in lieu of the subtransient and transient reactances.

Statement of Problem and Substantiation for Public Comment

Moving power factor to the first paragraph makes more sense, and is consistent with the practice from most manufacturers.

Need both rated ambient temp and the rated temperature rise for calculations. This is not an “or” condition.

Inverter based generators will require maximum short circuit current rating on the nameplate in lieu of the subtransient and transient reactances. This is an exception for just inverter based designs, so it should not be in the main text.

Putting all possible values for subtransient and transient reactances on the nameplate for reconnectible generators is not practical or necessary. The connection that gets chosen for the specific application, however, is relevant, and should be marked at the time of installation.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3617-NFPA 70-2015
Statement: “Power factor” has been relocated to the first paragraph of section 445.11 since it is common practice to mark this information on generators of all sizes.

Changes were accepted in the second paragraph to allow certain gen-set information to be placed in the manufacturer’s instructions rather than the nameplate.

“Synchronous” and “zero sequence” have been added to reactances since this information is also needed when modeling electrical systems.

The term “time-rating” was removed during the first draft stage but has been reinserted and renamed to “power rating category”. This change is necessary to clarify if the gen-set is intended for Prime, Continuous, Limited Time Running, or Emergency Standby Power use.
445.11 Marking.

Each generator shall be provided with a nameplate giving the manufacturer's name, the rated frequency, the number of phases if of ac, the rating in kilowatts or kilovolt-amperes, the normal volts and amperes corresponding to the rating, and the rated ambient temperature or rated temperature rise.

Nameplates for all stationary generators and portable generators rated more than 15 kW shall also give the power factor, the subtransient and transient reactances, and the insulation system class. Stationary generators shall be marked with the maximum short-circuit current, and the insulation system class. Stationary and portable generators shall be marked to indicate if the generator is protected against overload by inherent design, an overcurrent protective relay, circuit breaker, or fuse.

Marking shall be provided by the manufacturer to indicate whether or not the generator neutral is bonded to its frame. Where the bonding is modified in the field, additional marking shall be required to indicate whether the neutral is bonded to the frame.

Statement of Problem and Substantiation for Public Comment

There is no benefit to providing the maximum short-circuit current on a portable generator. Since there is no benefit there is no need for a requirement to provide this information. The short-circuit current information is only relevant on stationary generators as it is used for coordination of downstream overcurrent protection in a permanent installation.

Submittal Date: Fri Sep 25 12:42:10 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: The panel maintains that short-circuit or reactance information should be provided for all portable 15 kw or larger generators as indicated in 445.11.
445.11 Marking.

Each generator shall be provided with a nameplate giving the manufacturer's name, the rated frequency, the number of phases if of ac, the rating in kilowatts or kilovolt-amperes, the power factor, the normal volts and amperes corresponding to the rating, and the rated ambient temperature or rated temperature rise.

Nameplates for all stationary generators and portable generators rated more than 15 kW shall also give the power factor, the subtransient and transient reactances, the maximum short-circuit current, and the insulation system class. Stationary and portable generators shall be marked to indicate if the generator is protected against overload by inherent design, an overcurrent protective relay, circuit breaker, or fuse.

Marking shall be provided by the manufacturer to indicate whether or not the generator neutral is bonded to its frame. Where the bonding is modified in the field, additional marking shall be required to indicate whether the neutral is bonded to the frame.

Statement of Problem and Substantiation for Public Comment

Moving the requirement to show power factor to the first paragraph corresponds with current practice from most suppliers and this parameter is common across a very broad range of products.

The following paragraphs include information that is really useful only for a consulting engineer or other technically skilled person to verify that the machine delivered actually is what was ordered.

It is not possible for a manufacturer to state what the maximum available fault current is in a specific installation because grounding provisions impact on that value. The machine reactance data is required to be used by engineers to calculate what the value is for a specific installation. The site documentation should include the results of this documentation. If the engineer states the reactance data that was used to calculate fault current levels, and the reactance data on the machine matches (or is better than stated) the inspector can see clearly whether or not equipment fault current levels will be met. Note also that reactance data is often provided based on a standard machine rating and the machine is often applied at a different rating. A qualified engineer will know how to use this “per unit” data to calculate fault current levels.

Marking.

Each generator shall be provided with a nameplate giving the manufacturer's name, the rated frequency, the number of phases if of ac, the rating in kilowatts or kilovolt-amperes, the normal volts and amperes corresponding to the rating, and the rated ambient temperature or rated temperature rise.

Nameplates for or manufacturer's literature for all stationary generators and portable generators rated more than 15 kW shall also give the power factor, the synchronous, transient and subtransient and transient reactances, the maximum short-circuit current, and the insulation system class and the time rating. Stationary and portable generators shall be marked to indicate if the generator is protected against overload by inherent design, an overcurrent protective relay, circuit breaker, or fuse.

Marking shall be provided by the manufacturer to indicate whether or not the generator neutral is bonded to its frame. Where the bonding is modified in the field, additional marking shall be required to indicate whether the neutral is bonded to the frame.

Statement of Problem and Substantiation for Public Comment

Manufacturer's literature or the nameplate should retain the information about each generator. The maximum short circuit rating could be either synchronous or asynchronous. Depending on the reactance values proposed in this comment, the values can be determined or calculated based on the three reactances. In addition, the removal of the time rating removes the classification of the generator. The time rating needs to be included on the nameplate or in the literature.

Public Comment No. 508-NFPA 70-2015 [Section No. 445.11]

445.11 Marking.

Each generator shall be provided with a nameplate giving the manufacturer’s name, the rated frequency, the number of phases if of ac, the rating in kilowatts or kilovolt-amperes, the normal volts and amperes corresponding to the rating, and the rated ambient temperature or rated temperature rise.

Nameplates for all stationary generators and portable generators rated more than 15 kW shall also give the power factor, the subtransient and transient reactances, the maximum short-circuit current, and the insulation system class. Stationary and portable generators rated more than 15 kW shall be marked to indicate if the generator is protected against overload by inherent design, an overcurrent protective relay, circuit breaker, or fuse.

Marking shall be provided by the manufacturer to indicate whether or not the generator neutral is bonded to its frame. Where the bonding is modified in the field, additional marking shall be required to indicate whether the neutral is bonded to the frame.

Statement of Problem and Substantiation for Public Comment

It is not clear if the requirement for marking for protection against overload applies to all stationary generators and portable generators or only those rated more than 15 kW. Since this is in the same paragraph as another requirement for stationary generators and portable generators rated more than 15 kW, it is assumed that the intention was that the protection against overload marking would only apply to units rated more than 15 kW.

If this is not the case, then the second sentence of the second paragraph should become a separate paragraph and it should be clarified that it applies to all stationary and portable generators.

Public Comment No. 509-NFPA 70-2015 [Section No. 445.13(B)]

(B) Overcurrent Protection Provided.
Where the generator set is equipped with a listed overcurrent protective device, including a combination of a current transformer and overcurrent relay, conductors shall be permitted to be tapped from the load side of the protected terminals in accordance with 240.21(B).

Exception: This is not permitted for portable generators rated 15kW or less where field wiring connection points are not provided.

Statement of Problem and Substantiation for Public Comment

Field wiring connection points are not typically provided on portable generators rated 15 kW or less. These products are typically cord and plug-connected.

PGMA members represent a significant majority of the portable generator industry. Our member companies include:

Committee Action: Rejected
Resolution: The proposed exception is unnecessary since section 695.4(B)(3)(b) supplements or modifies the text in section 445.18(A). See 90.3 code arrangement.
 disconnecting means shall be lockable in the open position in accordance with 110.25.

Statement of Problem and Substantiation for Public Comment

IEC's position is to delete the word "simultaneously" be deleted from 445.18(A) - (FR 3661)

The IEC supports the majority of the change in section 445.18. The rewrite will clear up significant confusion in the industry with regard to generator disconnects. IEC recommends that the term “simultaneously” be deleted since this language could be interpreted by the local AHJ that all disconnects that are mounted on the generator must be interlocked to operate at the same exact time. We do not think that was the intent of the change.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3619-NFPA 70-2015
Statement: 445.18(A) has been revised to clarify that when multiple disconnects are installed on a gen-set each disconnect is only required to open its own specific set of ungrounded conductors. Interlocking is not required.
Public Comment No. 1200-NFPA 70-2015 [Section No. 445.18(B)]

(B) Shutdown of Prime Mover.
Generators shall have provisions to shut down the prime mover. This means of shutdown shall:

1. Be equipped with provisions to disable all prime mover start control circuits to render the prime mover incapable of starting
2. Initiate a shutdown mechanism that requires a mechanical reset

Generators with greater than 15 kW rating shall be provided with an additional remote requirement to shut down the prime mover. The additional shutdown means shall be located outside the equipment room or generator weatherproof housing enclosure.

The local requirement in 445.18(B) shall be permitted to satisfy the requirements of 445.18(A) where it is capable of being locked in the open position in accordance with 110.25.

Statement of Problem and Substantiation for Public Comment

Further clarity is needed in this section.

The first paragraph refers to a "local" shutdown means, and the second paragraph refers to a "remote" shutdown means. So we should add that to the text.

The third paragraph reference is ambiguous, so we should refer back to the proper specific paragraph (local shutdown).

State:
Zip:
Submittal Date: Thu Sep 24 12:24:41 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3620-NFPA 70-2015
Statement: This revision clarifies that the general provisions to shut down the prime mover may satisfy the requirements in 445.18(A) under the given conditions. The additional means located outside the equipment room is modified to meet the requirements of 445.18(B)(1) and (B)(2).

Not all generator enclosures are weatherproof so this portion of the requirement has been removed.

Editorial revisions were made for clarity.
(B) Shutdown of Prime Mover.

Generators shall have provisions to shut down the prime mover. The means of shutdown shall:

1. Be equipped with provisions to disable all prime mover start control circuits to render the prime mover incapable of starting
2. Initiate a shutdown mechanism that requires a mechanical reset

Generators with greater than 15-25 kW rating shall be provided with an additional requirement provision to shut down the prime mover. The additional shutdown means shall be located outside the equipment room or generator weatherproof housing enclosure.

The requirement in 445.18(B) shall be permitted to satisfy the requirements of 445.18(A) where it is capable of being locked in the open position in accordance with 110.25.

Exception: Generator controllers behind lockable doors shall meet the requirements.

Statement of Problem and Substantiation for Public Comment

Changing the 15 kW to 25 kW will avoid burdening residential installations with this requirement. The risk is minimal with generators smaller than 25kw.
The use of "requirement" does not seem to fit. The code is a list of requirements making it not necessary to call it out specifically.
"Provision" indicates that an additional item needs to be provided, which is the case here.
The exception will convey that a generator controller can adequately provide the functions required in 445.18(B).

Committee Statement

Committee Action: Rejected
Resolution: The exception is not necessary since 445.18(A) states that the disconnecting means requirement does not apply to portable generators that are cord-and-plug connected.
**Public Comment No. 1170-NFPA 70-2015 [ Section No. 445.20 ]**

445.20 Ground-Fault Circuit-Interrupter Protection for Receptacles on 15-kW or Smaller Portable Generators.

All 125-volt, single-phase, 15- and 20-ampere receptacle outlets that are a part of a 15-kW or smaller portable generator either shall have ground-fault circuit-interrupter protection for personnel integral to the generator or receptacle; or shall not be available for use when the 125/250-volt receptacle is in use. If the generator does not have a 125/250-volt receptacle, the requirement to disable the 125-volt, single-phase, 15- and 20-ampere receptacle outlets, provide ground-fault circuit-interrupter protection, shall not apply.

Exception: If the generator was manufactured or remanufactured prior to January 1, 2015, listed cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted.

Statement of Problem and Substantiation for Public Comment

This change will clarify which requirement shall not apply when a 125/250V receptacle is a part of the portable engine generator design. The editorial changes unfortunately did not provide clarity to this requirement.

Portable generators without 125/250V receptacles are typically lessor kW units and only supply 120V only loads directly connected to the outlets provided directly on the unit. These generators operate as a non-grounded system which is allowed by 250.34(A) and only supply 120V loads.

It is my understanding that CMP-13 agreed during the NFPA 70 2014’ code cycle that a floating neutral generator without integral GFCI protection on the 125V 15A and 20A receptacle outlets provides a perfectly safe operating condition and is acceptable as long as it does not have the capability of being connected to premises wiring by way of a 125/250V receptacle.

Submittal Date: Wed Sep 23 23:38:28 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: See Second Revision on section 445.20. The panel maintains that GFCI protection is necessary for all 125-volt 15- and 20-ampere receptacles located on a bonded neutral generator and is necessary for the same receptacles located on an unbonded or floating neutral generator.
Public Comment No. 512-NFPA 70-2015 [Section No. 445.20]

445.20  Ground-Fault Circuit-Interrupter Protection for Receptacles on 15-kW or Smaller Portable Generators.

All 125-volt, single-phase, 15- and 20-ampere receptacle outlets that are a part of a 15-kW or smaller portable generator that is equipped with a 125/250 volt receptacle, either shall have ground-fault circuit-interrupter protection for personnel integral to the generator or receptacle; or shall not be available for use when the 125/250-volt receptacle is in use. If the generator does not have a 125/250-volt receptacle, the requirement to disable the 125-volt, single-phase, 15- and 20-ampere receptacle outlets shall not apply.

Exception: If the generator was manufactured or remanufactured prior to January 1, 2015, listed cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted.

Statement of Problem and Substantiation for Public Comment

The committee statement in FR 3604 says: "This First Revision accepts the TIA language as permanent code text in the 2017 NEC version with certain editorial changes."

Unfortunately, the "editorial changes" completely change the intended requirement of 445.20. 445.20 was created during the NEC 2014 code cycle based on the acceptance of Comment 13-16 by CMP-13. The submitter's intention was made clear in the substantiation of Comment 13-16, which is copied below:

"GFCI protection is not necessary on systems that are not grounded for the reasons given in my comment to reject this proposal. However, when the generator is connected to a premises wiring system, whether it has a floating or bonded neutral, it becomes part of a bonded and grounded system. This has not been a safety problem because nobody uses the duplex receptacles when powering their house because they want as much power to the house as possible through the locking 125/250 volt receptacle which is the one they use to power their house. If the panel is still concerned, then protecting the duplex receptacles with a GFCI is one way to improve the situation but is not the only way. The generator could be built with a simple system to make the duplex receptacles unavailable when the 125/250 volt locking receptacle is being used. This would be more effective and economical than GFCI protection. If the panel is going to force a change in the design of a portable generator, the panel should allow the manufacturers the freedom to create better solutions. They are the ones that are familiar with the applications and will ultimately be responsible for product liability, not the code making panel."

It is recognized that the text of 445.20 as published in NEC 2014 is not clear. The last sentence says: "If the generator does not have a 125/250-volt locking-type receptacle, this requirement shall not apply." "This requirement" could be taken to mean either all of 445.20 does not apply or the requirement to disable the 125-volt, single-phase 15- and 20-ampere receptacle outlets does not apply. Clearly, the submitter of Comment 13-16 for NEC 2014 meant that all of 445.20 should not apply if there is no 125/250-volt receptacle.

Furthermore, it is my understanding that CMP-13 agreed during the NEC 2014 Code cycle that a floating neutral generator without integral GFCI protection on the 125-volt 15- and 20-ampere receptacle outlets is perfectly safe and acceptable as long as it does not have the capability of being connected to premises wiring by way of a 125/250-volt receptacle.

With the "editorial change" proposed for 445.20 in FR 3604, a portable generator sitting in the middle of a field (i.e. an ungrounded system) and no 125/250-volt receptacle will require GFCI's on all 125-volt, single-phase 15- and 20-ampere receptacle outlets. The GFCI's may not function as intended in this scenario if the portable generator is floating neutral or bonded neutral.

PGMA requests that CMP-13 carefully consider the ramifications of this "editorial change".

PGMA members represent a significant majority of the portable generator industry. Our member companies include:

- American Honda Motor Co.
- Briggs & Stratton Power Products Group LLC
- Champion Power Equipment
- Generac Power Systems
- Kipor Power Equipment, Inc.
- Subaru Industrial Power
- Techtronic Industries North America
- Wacker Neuson Production Americas LLC
- Yamaha Motor Corp USA

445.20 Ground-Fault Circuit-Interrupter Protection for Receptacles on 15-kW or Smaller Portable Generators.

All 125-volt, single-phase, 15- and 20-ampere receptacle outlets that are a part of a 15-kW or smaller portable generator either shall have ground-fault circuit-interrupter protection for personnel integral to the generator or receptacle; or shall not be allowed to be available for use when the 125/250-volt receptacle is in use. If the generator, a floating neutral generator, does not have a 125/250-volt receptacle, the requirement to disable the 125-volt, single-phase, 15- and 20-ampere receptacle outlets, clause 445.20 shall not apply.

Exception: If the generator was manufactured or remanufactured prior to January 1, 2015, listed cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted.

Statement of Problem and Substantiation for Public Comment

CMP 13 agreed during the previous Code cycle that a floating neutral generator without integral GFCI protection on the 125-volt 15- and 20-ampere receptacles is perfectly safe and acceptable as long as it does not have capability of being connected to premises wiring by way of a 125/250-volt locking receptacle, by virtue of the fact that it is not so equipped. This position was also supported by Underwriters Laboratories representatives. During the current Code cycle, CMP 13 reversed their position, but gave no technical substantiation for the reversal. A floating neutral generator as described here has no ability to generate a ground fault, and so does not need to contain integral GFCI protection. The proposed wording modification to Art 445.20 clarifies the conditions under which integral GFCI is necessary and those conditions under which it is not.

Committee Statement

Committee Action: Rejected
Resolution: See Second Revision on section 445.20. The panel maintains that GFCI protection is necessary for all 125-volt 15- and 20-ampere receptacles located on a bonded neutral generator and is necessary for the same receptacles located on an unbonded or floating neutral generator.
445.20  Ground-Fault Circuit-Interrupter Protection for Receptacles on 15-kW or Smaller Portable Generators.

All 125-volt, single-phase, 15- and 20-ampere receptacle outlets that are a part of a 15-kW or smaller portable generator either shall have listed ground-fault circuit-interrupter protection (GFCI) for personnel integral to the generator or receptacle, or shall not be, as indicated in either (A) or (B):

(A) Unbonded (Floating Neutral) Generators. Unbonded generators with 125-volt and 125/250-volt receptacle outlets shall have listed GFCI protection for personnel, integral to the generator or receptacle, on all, 125-volt, 15 and 20-ampere receptacle outlets.

Exception: GFCI protection shall not be required where the 125-volt receptacle outlets(s) are interlocked such that they are not available for use when any 125/250-volt receptacle is in use.

(B) Bonded Neutral Generators. Bonded generators shall be provided with GFCI protection on all 125-volt, 15 and 20-ampere receptacle outlets.

shall not apply

Informational Note: Refer to 590.6(A)(3) for GFCI requirements for 15-kW or smaller portable generators used for temporary electric power and lighting.

Exception

- to (A) and (B): If the generator was manufactured or remanufactured prior to January 1, 2015, listed cord sets or devices incorporating listed ground-fault circuit interrupter protection for personnel identified for portable use shall be permitted.

Statement of Problem and Substantiation for Public Comment

CMP-13 rolled PI 2572 into the cart when they accepted the action on the previous TIA to revise 445.20. I agree with the action to support the TIA. However clarity is needed and this proposed revision gets that done.

All GFCI protection should be listed.

It is necessary to separate the requirements for both bonded and unbonded generators. The requirements are different. Clarity is provided in new first level subdivision (A) to clearly require GFCI's at 125v, 15 and 20 amp only where both 125v and 125/250v receptacles exist on the generator. The exception for GFCI's at 125v is maintained for unbonded generators that are interlocked to disable the 125v receptacles when the 125/250v receptacles are in use. Significant clarity is provided in (B) to require that 125v, 15/20 amp receptacles outlets in bonded generators are always required to be GFCI protected. The present text misses that and must be corrected.

The new IN provides clarity by referring the code user to Article 590 for generators used in temporary power under the purview of Article 590.

The exception is editorially modified to apply to both first level subdivisions.

(B) Over 112 ½ kVA.

Individual dry-type transformers of more than 112 ½ kVA rating shall be installed in a transformer room of fire-resistant construction. Unless specified otherwise in this article, the term fire resistant means a construction having a minimum fire rating of 1 hour.

Exception No. 1: Transformers with Class 155 or higher insulation systems and separated from combustible material by a fire-resistant, heat-insulating barrier or by not less than 1.83 m (6 ft) horizontally and 3.7 m (12 ft) vertically.

Exception No. 2: Transformers with Class 155 or higher insulation systems and completely enclosed except for ventilating openings.

Public Comment No. 1802-NFPA 70-2015 [Section No. 450.23(A)]

(A) Indoor Installations.
Indoor installations shall be permitted in accordance with one of the following:

(1) In Type I or Type II buildings, in areas where all of the following requirements are met:
   a. The transformer is rated 35,000 volts or less.
   b. No combustible materials are stored.
   c. A liquid confinement area is provided.
   d. The installation complies with all the restrictions provided for in the listing of the liquid.
      Informational Note: Such restrictions may include, but are not limited to: maximum pressure of the tank, use
      of a pressure relief valve, appropriate fuse types and proper sizing of overcurrent protection.
   e. With an automatic fire extinguishing system and a liquid confinement area, provided the transformer is rated 35,000
      volts or less.

Committee Statement

Committee Action: Rejected
Resolution: The text in the First Revision is consistent with CMP 9’s revisions from the First Draft meeting; therefore, no
additional modifications are needed.
(B) Outdoor Installations.

Less-flammable liquid-filled transformers shall be permitted to be installed outdoors, attached to, adjacent to, or on the roof of buildings, where installed in accordance with 450.27.

Informational Note No. 1: Installations adjacent to combustible material, fire escapes, or door and window openings may require additional safeguards such as those listed in 450.27.

Informational Note No. 2: Such restrictions may include, but are not limited to: maximum pressure of the tank, use of a pressure relief valve, appropriate fuse types, and proper sizing of overcurrent protection.

Informational Note No. 3: As used in this section, Type I and Type II buildings refers to Type I and Type II building construction as defined in NFPA 220-2015, Standard on Types of Building Construction. Combustible materials refers to those materials not classified as noncombustible or limited-combustible as defined in NFPA 220-2015, Standard on Types of Building Construction.

Informational Note No. 4: See definition of Listed in Article 100.

Statement of Problem and Substantiation for Public Comment

The CC directs that further consideration be provided to the comments expressed in voting on FR 7515.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-2415-NFPA 70-2015
Statement: The panel statement on the First Draft ballot was in error, as it recapitulates the original substantiation of PI 4666 and is not the statement voted by the panel. Based on comments submitted by CMP members during the Balloting, the correct statement is as follows:

"Transformer fluids are evaluated in accordance with the Standard for Test for Comparative Flammability of Liquids, UL 340. These liquids are evaluated for characteristics such as Flash Point, Fire Point and Dielectric Strength. Many of these liquids also have restrictions, such as maximum tank pressure, use of pressure relief valves, appropriate fuse types and proper sizing of overcurrent protection, which should be part of the installation considerations."

Additionally, the First Revision that is noted in the record has incorrectly renumbered/reformatted this Subsection. This change in the Second Draft restores the work done by Panel 9 at the First Draft meeting.

This revision also addresses the comments from the Correlating Committee expressed in PC #429.
Public Comment No. 429-NFPA 70-2015 [Section No. 450.23(B)]

(B) Outdoor Installations.

Less-flammable liquid-filled transformers shall be permitted to be installed outdoors, attached to, adjacent to, or on the roof of buildings, where installed in accordance with 450.27.

(1) or (2):

(1) For Type I and Type II buildings, the installation shall comply with all the restrictions provided for in the listing of the liquid.

Informational Note No. 1: Installations adjacent to combustible material, fire escapes, or door and window openings may require additional safeguards such as those listed in 450.27.

Informational Note No. 2: Such restrictions may include, but are not limited to: maximum pressure of the tank, use of a pressure relief valve, appropriate fuse types, and proper sizing of overcurrent protection.

(2) In accordance with 450.27

Informational Note No. 3: As used in this section, Type I and Type II buildings refers to Type I and Type II building construction as defined in NFPA 220-2015, Standard on Types of Building Construction. Combustible materials refers to those materials not classified as noncombustible or limited-combustible as defined in NFPA 220-2015, Standard on Types of Building Construction.

Informational Note No. 4: See definition of Listed in Article 100.

Statement of Problem and Substantiation for Public Comment

The panel statement on the ballot is in error, as it recapitulates the original substantiation of PI 4666 and is not the statement voted by the panel. Based on comments submitted by CMP members during the Balloting, the correct statement is as follows:

“Transformer fluids are evaluated in accordance with the Standard for Test for Comparative Flammability of Liquids, UL 340. These liquids are evaluated for characteristics such as Flash Point, Fire Point and Dielectric Strength. Many of these liquids also have restrictions, such as maximum tank pressure, use of pressure relief valves, appropriate fuse types and proper sizing of overcurrent protection, which should be part of the installation considerations.”

Additionally, the First Revision that is noted in the record has incorrectly renumbered/reformatted this Subsection. Note that this Comment appears to miss the formatting required to make the requirements as subsections (1) and (2) of 450.23(B).

450.42 Walls, Roofs, and Floors.

The walls and roofs of vaults shall be constructed of materials that have approved structural strength for the conditions with a minimum fire resistance of 3 hours. The floors of vaults in contact with the earth shall be of concrete that is not less than 100 mm (4 in.) thick, but, where the vault is constructed with a vacant space or other stories below it, the floor shall have approved structural strength for the load imposed thereon and a minimum fire resistance of 3 hours. For the purposes of this section, studds and wallboard construction shall not be permitted.

Exception: Where transformers are protected with automatic sprinkler, water spray, carbon dioxide, or halon, construction of 1-hour rating shall be permitted.

Informational Note No. 1: For additional information, see ANSI/ASTM E119-2012a Method for Fire Tests of Building Construction and Materials.

Informational Note No. 2: A typical 3-hour construction is 150 mm (6 in.) thick reinforced concrete.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-2416-NFPA 70-2015
Statement: This Informational Note is updated to reflect the latest version and title of the standard being referenced.
Article 480 - Storage Batteries

480.1 - Scope.
This article applies to all stationary installations of storage batteries.

Informational Note: The following standards are frequently referenced for the installation of stationary batteries:

1. IEEE 484-2008, Recommended Practice for Installation Design and Installation of Vented Lead-Acid Batteries for Stationary Applications

2. IEEE 485-1997, Recommended Practice for Sizing Vented Lead-Acid Storage Batteries for Stationary Applications

3. IEEE 1145-2007, Recommended Practice for Installation and Maintenance of Nickel-Cadmium Batteries for Photovoltaic (PV) Systems

4. IEEE 1187-2007, Recommended Practice for Installation Design, and Installation of Valve-Regulated Lead-Acid Batteries for Stationary Applications

6. IEEE 1578-2007, Recommended Practice for Stationary Battery Spill Containment and Management

8. UL 1973, Batteries for Use in Light Electric Rail (LER) Applications and Stationary Applications

9. UL Subject 2436, Spill Containment for Stationary Lead Acid Battery Systems

10. UL 1989, Standby Batteries

480.2 - Definitions.

Cell.
The basic electrochemical unit, characterized by an anode and a cathode, used to receive, store, and deliver electrical energy.

Container.
A vessel that holds the plates, electrolyte, and other elements of a single unit in a battery.

Informational Note: A container may be single-cell or multi-cell and is sometimes referred to in the industry as a “jar.”

Electrolyte.
The medium that provides the ion transport mechanism between the positive and negative electrodes of a cell.

Intercell Connector.
An electrically conductive bar or cable used to connect adjacent cells.

Intertier Connector.
An electrical conductor used to connect two cells on different tiers of the same rack or different shelves of the same rack.

Nominal Voltage (Battery or Cell).
The value assigned to a cell or battery of a given voltage class for the purpose of convenient designation. The operating voltage of the cell or battery may vary above or below this value.

Informational Note: The most common nominal cell voltages are 2 volts per cell for the lead-acid systems, 1.2 volts per cell for alkaline systems, and 3.6 to 3.8 volts per cell for Li-ion systems. Nominal voltages might vary with different chemistries.

Sealed Cell or Battery.
A cell or battery that has no provision for the routine addition of water or electrolyte or for external measurement of electrolyte specific gravity and might contain pressure relief venting.

Storage Battery.
A battery comprised of one or more rechargeable cells of the lead-acid, nickel-cadmium, or other rechargeable electrochemical types.

Terminal.
That part of a cell, container, or battery to which an external connection is made (commonly identified as post, pillar, pole, or terminal post).
480.3 - Battery and Cell Terminations.

(A) - Corrosion Prevention.
Where mating dissimilar metals, antioxidant material suitable for the battery connection shall be used where recommended by
the battery manufacturer.

Informational Note: The battery manufacturer's installation and instruction manual can be used for guidance for
acceptable materials.

(B) - Intercell and Intertier Conductors and Connections.
The ampacity of field-assembled intercell and intertier connectors and conductors shall be of such cross-sectional area that the
temperature rise under maximum load conditions and at maximum ambient temperature shall not exceed the safe operating
temperature of the conductor insulation or of the material of the conductor supports.

Informational Note: Conductors sized to prevent a voltage drop exceeding 3 percent of maximum anticipated load, and
where the maximum total voltage drop to the furthest point of connection does not exceed 5 percent, may not be
appropriate for all battery applications. IEEE 1375-2003, Guide for the Protection of Stationary Battery Systems,
provides guidance for overcurrent protection and associated cable sizing.

(C) - Battery Terminals.
Electrical connections to the battery, and the cable(s) between cells on separate levels or racks, shall not put mechanical strain
on the battery terminals. Terminal plates shall be used where practicable.

Informational Note: Conductors are commonly pre-formed to eliminate stress on battery terminations. Fine stranded
cables may also eliminate the stress on battery terminations. See the manufacturer's instructions for guidance.

480.4 - Wiring and Equipment Supplied from Batteries.
Wiring and equipment supplied from storage batteries shall be subject to the applicable provisions of this Code
applying to wiring and equipment operating at the same voltage, unless otherwise permitted by 480.5.

480.5 - Overcurrent Protection for Prime Movers.
Overcurrent protection shall not be required for conductors from a battery with a nominal voltage of 50 volts or less if the battery
provides power for starting, ignition, or control of prime movers. Section 300.3 shall not apply to these conductors.

480.6 - DC Disconnect Methods.

(A) - Disconnecting Means.
A disconnecting means shall be provided for all ungrounded conductors derived from a stationary battery system with a nominal
voltage over 50 volts. A disconnecting means shall be readily accessible and located within sight of the battery system.

Informational Note: See 240.21(H) for information on the location of the overcurrent device for battery conductors.

(B) - Remote Actuation.
Where a disconnecting means, located in accordance with 480.6(A), is provided with remote controls to activate the
disconnect means and the controls for the disconnecting means are not located within sight of the stationary battery system,
the disconnecting means shall be capable of being locked in the open position, in accordance with 110.25, and the location of
the controls shall be field marked on the disconnecting means.

(C) - Busway.
Where a DC busway system is installed, the disconnecting means shall be permitted to be incorporated into the busway.

(D) - Notification.
The disconnecting means shall be legibly marked in the field. A label with the marking shall be placed in a conspicuous location
near the battery if a disconnecting means is not provided. The marking shall be of sufficient durability to withstand the
environment involved and shall include the following:

(1) Nominal battery voltage
(2) Maximum available fault current derived from the stationary battery system
(3) Date the fault current calculation was performed
(4) The battery disconnecting means shall be marked in accordance with 110.16.

Informational Note No. 1: Battery equipment suppliers can provide information about short-circuit current on any
particular battery model.

Informational Note No. 2: The available fault-current marking(s) addressed in 480.6(D)(2) is related to required short
circuit current ratings of equipment. NFPA 70E-2015, Standard for Electrical Safety in the Workplace, provides
assistance in determining the severity of potential exposure, planning safe work practices, and selecting personal
protective equipment.

480.7 - Insulation of Batteries.
Batteries constructed of an electrically conductive container shall have insulating support if a voltage is present between the
container and ground.
480.8 - Battery Support Systems.

For battery chemistries with corrosive electrolyte, the structure that supports the battery shall be resistant to deteriorating action by the electrolyte. Metallic structures shall be provided with nonconducting support members for the cells, or shall be constructed with a continuous insulating material. Paint alone shall not be considered as an insulating material.

The terminals of all cells or multi-cell units shall be readily accessible for readings, inspection, and cleaning where required by the equipment design. One side of transparent battery containers shall be readily accessible for inspection of the internal components.

480.9 - Battery Locations.

Battery locations shall conform to 480.9(A), (B), and (C).

(A) - Ventilation.

Provisions appropriate to the battery technology shall be made for sufficient diffusion and ventilation of gases from the battery, if present, to prevent the accumulation of an explosive mixture.

Informational Note No. 1: See NFPA 1-2015, Fire Code, Chapter 52, for ventilation considerations for specific battery chemistries.

Informational Note No. 2: Some battery technologies do not require ventilation.

(B) - Live Parts.

Guarding of live parts shall comply with 110.27.

(C) - Spaces About Battery Systems.

Spaces about battery systems shall comply with 110.26. Working space shall be measured from the edge of the battery cabinet, racks, or trays.

For battery racks, there shall be a minimum clearance of 25 mm (1 in.) between a cell container and any wall or structure on the side not requiring access for maintenance. Battery stands shall be permitted to contact adjacent walls or structures, provided that the battery shelf has a free air space for not less than 90 percent of its length.

Informational Note: Additional space is often needed to accommodate battery hoisting equipment, tray removal, or spill containment.

(D) - Top Terminal Batteries.

Where top terminal batteries are installed on tiered racks or on shelves of battery cabinets, working space in accordance with the battery manufacturer’s instructions shall be provided between the highest point on a cell and the row, shelf, or ceiling above that point.

Informational Note: IEEE 1187-2013, IEEE Recommended Practice for Installation Design and Installation of Valve-Regulated Lead-Acid Batteries for Stationary Applications, provides guidance for top clearance of valve-regulated lead-acid batteries, which are commonly used in battery cabinets.

(E) - Egress.

A personnel door(s) intended for entrance to, and egress from, rooms designated as battery rooms shall open in the direction of egress and shall be equipped with listed panic hardware.

(F) - Piping in Battery Rooms.

Gas piping shall not be permitted in dedicated battery rooms.

(G) - Illumination.

Illumination shall be provided for working spaces containing battery systems. The lighting outlets shall not be controlled by automatic means only. Additional lighting outlets shall not be required where the work space is illuminated by an adjacent light source. The location of luminaires shall not:

1. Expose personnel to energized battery components while performing maintenance on the luminaires in the battery space; or

2. Create a hazard to the battery upon failure of the luminaire.

480.10 - Vents.

(A) - Vented Cells.

Each vented cell shall be equipped with a flame arrester.

Informational Note: A flame arrester prevents destruction of the cell due to ignition of gases within the cell by an external spark or flame.

(B) - Sealed Cells.

Where the battery is constructed such that an excessive accumulation of pressure could occur within the cell during operation, a pressure-release vent shall be provided.
Statement of Problem and Substantiation for Public Comment

This proposal is related to the new Article 706, Energy Storage Systems (FR 3662). Currently batteries are addressed in numerous places in the NEC such as Articles 480 and 690, which has been appropriate over time with the former article historically covering lead-acid batteries and the latter recently added to address the application of batteries in general, not just lead acid, to PV systems. The current state of energy storage technology, which includes batteries, and anticipated evolution of energy storage supports the need for a singular set of requirements in the NEC covering such systems. If this is not accomplished in the 2017 NEC and available to serve as a singular foundation for needed changes in the future, the provisions covering such systems will continue to reside in different places within the NEC and likely evolve to attach themselves as parts to existing criteria throughout the NEC. To foster the safe application of energy storage systems and facilitate the application and use of the NEC by technology proponents as well as those who install and inspect such systems there should be a singular article in the NEC on energy storage systems.

Committee Statement

Committee Action: Rejected
Resolution: The removal of Article 480 has broad implications to the industry and the correlation of content with Article 706 should be reviewed by a Correlating Committee task group for recommendations next cycle. Chapter 4 requirements for electrical equipment provide necessary coverage for general utilization equipment and may not be completely encompassed in the Article 706 scope.
480.1 Scope.

This article applies to all stationary installations of storage batteries.

Informational Note: The following standards are frequently referenced for the installation of stationary batteries:

1. IEEE 484-2008, *Recommended Practice for Installation Design and Installation of Vented Lead-Acid Batteries for Stationary Applications*

6. IEEE 1578-2007, *Recommended Practice for Stationary Battery Spill Containment and Management*

8. UL 1973-2013, *Batteries for Use in Light Electric Rail (LER) Applications and Stationary Applications*

9. UL Subject 2436, *Outline*, *Spill Containment for Stationary Lead Acid Battery Systems*

10. UL 1989, *Standby Batteries*

Statement of Problem and Substantiation for Public Comment

Referenced current edition of standards.

Resolution: SR-3628-NFPA 70-2015
Statement: The documents referenced within the informational note provide common resources for stationary battery systems. The document titles were corrected and the inclusion of a particular edition or publication date for these documents is removed since the applicability of this information is determined by the user.
Statement of Problem and Substantiation for Public Comment

The new text proposed by Public Input No. 3550-NFPA 70-2014 should be accepted. This Public Input (PI) sought to add a new section requiring listing of storage batteries for chemistries other than lead-acid, and for battery management systems. The proposal clearly sought to exclude installations addressing traditional lead-acid technology, which has been used for many years and is well understood.

However, new advanced battery technologies are not your father’s lead-acid auto batteries. As energy density has continued to increase in advanced batteries, driving more energy into smaller physical packages, the consequences of battery failure modes have increased significantly. Advanced battery technologies can be placed into unsafe operating modes, which can lead to thermal runaway, fires and explosions. This is particularly applicable to battery chemistries such as lithium-ion which have flammable electrolytes. A fault event within a single battery can quickly be driven by the chemistry to cascade to an event that consumes the battery; similarly, an event within a single battery can cascade to a large scale event. Rigorous validation of the battery design for safety is especially critical for these advanced technologies. Further, the manufacturing process of advanced batteries is critical to their safety; small contaminants in the manufacturing process can lead to the formation of dendrites over the life of the battery, which can cause catastrophic consequences.

The significant consequences from battery failures have been seen in the many advanced technology battery-related events in the news involving unlisted batteries, from the total destruction of a battery energy storage facility in Hawaii from fire in 2012, to the impacts of a Tesla automotive battery forcing the battery into a dramatic failure more, to the events involving the Boeing 787 Dreamliner. In the latter case, the intensive investigation by the US National Transportation Safety Board (NTSB), which UL supported through extensive scientific testing and analysis, led to NTSB making specific recommendations (http://www.ntsb.gov/investigations/Pages/boeing_787.aspx, “Auxiliary Power Unit Battery Fire Japan Airlines Boeing 787-8, JA829J”, Section 4, pp 81-83) to better address testing and compliance of advanced batteries. The same technical issues that drove those battery incidents in different sectors are also applicable within the electrical infrastructure for advanced batteries. For the electrical infrastructure, we already have the benefit of existing and proven American National Standards to proactively address safety – we just have to use them.

The PI Committee statement that resolved the PI in the First Draft stage indicates “Battery systems other than lead-acid are often field constructed and may contain unlisted components. Requiring listing of such systems is not practical due to numerous variations in the system type. Many new technologies precede the development of standards requirements in order to provide a listed product.” The statement illustrates several issues that require further consideration by the Panel.

First, this proposal does not seek to require listing of battery systems in Article 480 – it only addresses listing of the batteries themselves and battery management systems. Battery management systems are specific functional elements that use electronics to manage the charging and operation of batteries in such a way that the battery is not put into an unsafe mode. They are typically incorporated into stationary batteries and in this case are addressed by the listing of the battery to ANSI/UL 1973 or other applicable standards. If battery management systems are provided separate from the batteries, they should be required to be listed as they play a critical role in mitigating the fire and explosions hazards associated with the battery installation; in this case, compliance to the applicable safety standards verified through listing is a measure of due diligence to address the safety of the installation and validate that the battery management system electronics can adequately and reliably fulfill their functional safety role.

Second, American National Standards have been developed to address battery safety. These include ANSI/UL 1642 for lithium batteries and ANSI/UL 1973 for stationary batteries of all chemistries. These standards contain fundamental safety requirements to assess proper measures of mitigation of the inherent hazards presented by batteries. Leverage the safety afforded by compliance with the established American National Standards is a reasonable and appropriate safety measure. It is not clear what new battery technologies are envisioned, but ANSI/UL 1973 is chemistry agnostic and provides an appropriate measure of diligence for different technologies. Further, introducing an unknown and unlisted technology, that has not been shown to comply with any safety standards, truly presents significant risk. Based on the complexity of the battery design, manufacturing, validation, and integration processes, listing is a reasonable and important measure to support approval of the advanced battery installation by AHJs.

As energy demands grow rapidly, many stationary batteries will be introduced into our electrical infrastructure in the next several years. American National Standards exist for stationary batteries to support a practical and reasonable implementation of this technology within the electrical infrastructure in the safest way. I urge the Panel to be proactive in supporting a safe energy storage infrastructure, and add the proposed new requirements to Article 480.

Public Comment No. 1421-NFPA 70-2015 [Section No. 480.6(D)]

(D) Notification.

The disconnecting means shall be legibly marked in the field. A label with the marking shall be placed in a conspicuous location near the battery if a disconnecting means is not provided. The marking shall be of sufficient durability to withstand the environment involved and shall include the following:

1. Nominal battery voltage
2. Maximum available fault current, short circuit current, derived from the stationary battery system
3. Date the fault current calculation was performed of the short circuit current determination
4. The battery disconnecting means shall be marked in accordance with 110.16.

Informational Note No. 1: Battery equipment suppliers can provide information about short-circuit current on any particular battery model.

Informational Note No. 2: The available fault-current marking(s) addressed in 480.6(D)(2) is related to required short circuit current ratings of equipment. NFPA 70E-2015, Standard for Electrical Safety in the Workplace, provides assistance in determining the severity of potential exposure, planning safe work practices, and selecting personal protective equipment.

Statement of Problem and Substantiation for Public Comment

Battery systems are unique when it comes to short circuit current. One cannot approach a rack of batteries and calculate available fault current. Only the battery manufacturer has that information, and they will provide "available short circuit current" not "available fault current."

It is imperative to understand the reason for this marking. When working on batteries, several hazards may exist including shock, arc flash and chemical hazards. When determining the necessary PPE for exposure to the arc flash hazard, the table method is the most widely used method as labeled systems are not a requirement of federal regulation or installation codes. When using the table method in 130.7(C)(15)(B), the user needs the "available short circuit current."

The NEC Correlating Committee has appointed a task group to address the use of the terms "available short circuit current" and "available fault current." That work will be submitted for the 2020 edition of the NEC. In this case, the correct term is "available short circuit current." Ask any battery manufacturer what value they supply. We need to get this right.

Public Comment No. 1476-NFPA 70-2015 [Section No. 480.6(D)]

(D) Notification. The disconnecting means shall be legibly marked in the field. A label with the marking shall be placed in a conspicuous location near the battery if a disconnecting means is not provided. The marking shall be of sufficient durability to withstand the environment involved and shall include the following:

1. Nominal battery voltage
2. Maximum available fault short-circuit current derived from the stationary battery system
3. Date the fault short-circuit current calculation was performed
4. The battery disconnecting means shall be marked in accordance with 110.16.

Informational Note No. 1: Battery equipment suppliers can provide information about short-circuit current on any particular battery model.

Informational Note No. 2: The available fault short-circuit current marking(s) addressed in 480.6(D)(2) is related to required short circuit current ratings of equipment. NFPA 70E-2015, Standard for Electrical Safety in the Workplace, provides assistance in determining the severity of potential exposure, planning safe work practices, and selecting personal protective equipment.

Statement of Problem and Substantiation for Public Comment

The term short-circuit current is typically more suitable for the intended use in this section. Battery manufacturers commonly use the term short-circuit current for the information needed in this section.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Committee Statement

Committee Action: Rejected

Resolution: The panel recognizes that the correlating committee reversed actions to add "listed and labeled" in all cases and a task group is reviewing this issue for the next NEC cycle.
Article 490  Equipment Over 1000, 1500 Volts, Nominal

Part I.  General

490.1  Scope.
This article covers the general requirements for equipment operating at more than 1000, 1500 volts, nominal.

Informational Note No. 1: See NFPA 70E-2015, Standard for Electrical Safety in the Workplace, for electrical safety requirements for employee workplaces.

Informational Note No. 2: For further information on hazard signs and labels, see ANSI Z535.4-1998, Product Signs and Safety Labels.

490.2  Definition.

High Voltage.
For the purposes of this article, more than 1000, 1500 volts, nominal.

490.3  Other Articles.

(A)  Oil-Filled Equipment.
Installation of electrical equipment, other than transformers covered in Article 450, containing more than 38 L (10 gal) of flammable oil per unit shall meet the requirements of Parts II and III of Article 450.

(B)  Enclosures in Damp or Wet Locations.
Enclosures in damp or wet locations shall meet the requirements of 312.2.

Part II.  Equipment — Specific Provisions

490.21  Circuit-Interrupting Devices.

(A)  Circuit Breakers.

(1)  Location.

(a) Circuit breakers installed indoors shall be mounted either in metal-enclosed units or fire-resistant cell-mounted units, or they shall be permitted to be open-mounted in locations accessible to qualified persons only.

(b) Circuit breakers used to control oil-filled transformers in a vault shall either be located outside the transformer vault or be capable of operation from outside the vault.

(c) Oil circuit breakers shall be arranged or located so that adjacent readily combustible structures or materials are safeguarded in an approved manner.

(2)  Operating Characteristics.
Circuit breakers shall have the following equipment or operating characteristics:

(1)  An accessible mechanical or other identified means for manual tripping, independent of control power

(2)  Be release free (trip free)

(3)  If capable of being opened or closed manually while energized, main contacts that operate independently of the speed of the manual operation

(4)  A mechanical position indicator at the circuit breaker to show the open or closed position of the main contacts

(5)  A means of indicating the open and closed position of the breaker at the point(s) from which they may be operated

(3)  Nameplate.
A circuit breaker shall have a permanent and legible nameplate showing manufacturer’s name or trademark, manufacturer’s type or identification number, continuous current rating, interrupting rating in megavolt-amperes (MVA) or amperes, and maximum voltage rating. Modification of a circuit breaker affecting its rating(s) shall be accompanied by an appropriate change of nameplate information.
(4) Rating.

Circuit breakers shall have the following ratings:

1. The continuous current rating of a circuit breaker shall not be less than the maximum continuous current through the circuit breaker.
2. The interrupting rating of a circuit breaker shall not be less than the maximum fault current the circuit breaker will be required to interrupt, including contributions from all connected sources of energy.
3. The closing rating of a circuit breaker shall not be less than the maximum asymmetrical fault current into which the circuit breaker can be closed.
4. The momentary rating of a circuit breaker shall not be less than the maximum asymmetrical fault current at the point of installation.
5. The rated maximum voltage of a circuit breaker shall not be less than the maximum circuit voltage.

(B) Power Fuses and Fuseholders.

1. Use.

Where fuses are used to protect conductors and equipment, a fuse shall be placed in each ungrounded conductor. Two power fuses shall be permitted to be used in parallel to protect the same load if both fuses have identical ratings and both fuses are installed in an identified common mounting with electrical connections that divide the current equally. Power fuses of the vented type shall not be used indoors, underground, or in metal enclosures unless identified for the use.

2. Interrupting Rating.

The interrupting rating of power fuses shall not be less than the maximum fault current the fuse is required to interrupt, including contributions from all connected sources of energy.

The maximum voltage rating of power fuses shall not be less than the maximum circuit voltage. Fuses having a minimum recommended operating voltage shall not be applied below this voltage.

4. Identification of Fuse Mountings and Fuse Units.

Fuse mountings and fuse units shall have permanent and legible nameplates showing the manufacturer’s type or designation, continuous current rating, interrupting current rating, and maximum voltage rating.

5. Fuses.

Fuses that expel flame in opening the circuit shall be designed or arranged so that they function properly without hazard to persons or property.

6. Fuseholders.

Fuseholders shall be designed or installed so that they are de-energized while a fuse is being replaced. A field-applied permanent and legible sign, in accordance with 110.21(B), shall be installed immediately adjacent to the fuseholders and shall be worded as follows:

DANGER — DISCONNECT CIRCUIT BEFORE REPLACING FUSES.

Exception: Fuses and fuseholders designed to permit fuse replacement by qualified persons using identified equipment without de-energizing the fuseholder shall be permitted.

7. High-Voltage Fuses.

Switchgear and substations that utilize high-voltage fuses shall be provided with a gang-operated disconnecting switch. Isolation of the fuses from the circuit shall be provided by either connecting a switch between the source and the fuses or providing roll-out switch and fuse-type construction. The switch shall be of the load-interrupter type, unless mechanically or electrically interlocked with a load-interrupting device arranged to reduce the load to the interrupting capability of the switch.

Exception: More than one switch shall be permitted as the disconnecting means for one set of fuses where the switches are installed to provide connection to more than one set of supply conductors. The switches shall be mechanically or electrically interlocked to permit access to the fuses only when all switches are open. A conspicuous sign shall be placed at the fuses identifying the presence of more than one source.

(C) Distribution Cutouts and Fuse Links — Expulsion Type.

1. Installation.

Cutouts shall be located so that they may be readily and safely operated and re-fused, and so that the exhaust of the fuses does not endanger persons. Distribution cutouts shall not be used indoors, underground, or in metal enclosures.

2. Operation.

Where fused cutouts are not suitable to interrupt the circuit manually while carrying full load, an approved means shall be installed to interrupt the entire load. Unless the fused cutouts are interlocked with the switch to prevent opening of the cutouts under load, a conspicuous sign shall be placed at such cutouts identifying that they shall not be operated under load.

3. Interrupting Rating.

The interrupting rating of distribution cutouts shall not be less than the maximum fault current the cutout is required to interrupt, including contributions from all connected sources of energy.

(6) Supply Terminals.

The supply terminals of fused interrupter switches shall be installed at the top of the switch enclosure, or, if the terminals are located elsewhere, the equipment shall have barriers installed so as to prevent persons from accidentally contacting energized parts or dropping tools or fuses into energized parts.

490.22 Isolating Means.

Means shall be provided to completely isolate an item of equipment from all ungrounded conductors. The use of isolating switches shall not be required where there are other ways of de-energizing the equipment for inspection and repairs, such as draw-out-type switchgear units and removable truck panels.

Isolating switches not interlocked with an approved circuit-interrupting device shall be provided with a sign warning against opening them under load. The warning sign(s) or label(s) shall comply with 110.21(B).

An identified fuseholder and fuse shall be permitted as an isolating switch.

490.23 Voltage Regulators.

Proper switching sequence for regulators shall be ensured by use of one of the following:

1. Mechanically sequenced regulator bypass switch(es)
2. Mechanical interlocks
3. Switching procedure prominently displayed at the switching location

490.24 Minimum Space Separation.

In field-fabricated installations, the minimum air separation between bare live conductors and between such conductors and adjacent grounded surfaces shall not be less than the values given in Table 490.24. These values shall not apply to interior portions or exterior terminals of equipment designed, manufactured, and tested in accordance with accepted national standards.

Note: The values given are the minimum clearance for rigid parts and bare conductors under favorable service conditions. They shall be increased for conductor movement or under unfavorable service conditions or wherever space limitations permit. The selection of the associated impulse withstand voltage for a particular system voltage is determined by the characteristics of the surge protective equipment.
490.25 Backfeed.
Installations where the possibility of backfeed exists shall comply with (a) and (b), which follow.

(a) A permanent sign in accordance with 110.21(B) shall be installed on the disconnecting means enclosure or immediately adjacent to open disconnecting means with the following words or equivalent: DANGER — CONTACTS ON EITHER SIDE OF THIS DEVICE MAY BE ENERGIZED BY BACKFEED.

(b) A permanent and legible single-line diagram of the local switching arrangement, clearly identifying each point of connection to the high-voltage section, shall be provided within sight of each point of connection.

Part III. Equipment — Switchgear and Industrial Control Assemblies

490.30 General.
Part III covers assemblies of switchgear and industrial control equipment including, but not limited to, switches and interrupting devices and their control, metering, protection, and regulating equipment where they are an integral part of the assembly, with associated interconnections and supporting structures. Part III also includes switchgear assemblies that form a part of unit substations, power centers, or similar equipment.

490.31 Arrangement of Devices in Assemblies.
Arrangement of devices in assemblies shall be such that individual components can safely perform their intended function without adversely affecting the safe operation of other components in the assembly.

490.32 Guarding of High-Voltage Energized Parts Within a Compartment.
Where access for other than visual inspection is required to a compartment that contains energized high-voltage parts, barriers shall be provided to prevent accidental contact by persons, tools, or other equipment with energized parts. Exposed live parts shall only be permitted in compartments accessible to qualified persons. Fuses and fuseholders designed to enable future replacement without de-energizing the fuseholder shall only be permitted for use by qualified persons.

490.33 Guarding of Energized Parts Operating at 1000 Volts, Nominal, or Less Within Compartments.
Energized bare parts mounted on doors shall be guarded where the door must be opened for maintenance of equipment or removal of draw-out equipment.

490.34 Clearance for Cable Conductors Entering Enclosure.
The unobstructed space opposite terminals or opposite raceways or cables entering a switchgear or control assembly shall be approved for the type of conductor and method of termination.

490.35 Accessibility of Energized Parts.
(A) High-Voltage Equipment.
Doors that would provide unqualified persons access to high-voltage energized parts shall be locked. Permanent signs in accordance with 110.21(B) shall be installed on panels or doors that provide access to live parts over 1000 volts and shall read DANGER — HIGH VOLTAGE — KEEP OUT.

(B) Control Equipment.
Where operating at 1000 volts, nominal, or less, control equipment, relays, motors, and the like shall not be installed in compartments with exposed high-voltage energized parts or high-voltage wiring, unless either of the following conditions is met:

1. The access means is interlocked with the high-voltage switch or disconnecting means to prevent the access means from being opened or removed.

2. The high-voltage switch or disconnecting means is in the isolating position.

(C) High-Voltage Instruments or Control Transformers and Space Heaters.
High-voltage instrument or control transformers and space heaters shall be permitted to be installed in the high-voltage compartment without access restrictions beyond those that apply to the high-voltage compartment generally.

490.36 Grounding.
Frames of switchgear and control assemblies shall be connected to an equipment grounding conductor or, where permitted, the grounded conductor.

490.37 Grounding of Devices.
The metal cases or frames, or both, such as those of instruments, relays, meters, and instrument and control transformers, located in or on switchgear or control assemblies, shall be connected to an equipment grounding conductor or, where permitted, the grounded conductor.

490.38 Door Stops and Cover Plates.
External hinged doors or covers shall be provided with stops to hold them in the open position. Cover plates intended to be removed for inspection of energized parts or wiring shall be equipped with lifting handles and shall not exceed 1.1 m² (12 ft²) in area or 27 kg (60 lb) in weight, unless they are hinged and bolted or locked.

490.39 Gas Discharge from Interrupting Devices.
Gas discharged during operating of interrupting devices shall be directed so as not to endanger personnel.
490.40 Visual Inspection Windows.
Windows intended for visual inspection of disconnecting switches or other devices shall be of suitable transparent material.

490.41 Location of Industrial Control Equipment.
Routinely operated industrial control equipment shall meet the requirements of (A) unless infrequently operated, as covered in 490.41(B).

(A) Control and Instrument Transfer Switch Handles or Push Buttons.
Control and instrument transfer switch handles or push buttons shall be in a readily accessible location at an elevation of not over 2.0 m (6 ft 7 in.).

Exception: Operating handles requiring more than 23 kg (50 lb) of force shall be located no higher than 1.7 m (66 in.) in either the open or closed position.

(B) Infrequently Operated Devices.
Where operating handles for such devices as draw-out fuses, fused potential or control transformers and their primary disconnects, and bus transfer and isolating switches are only operated infrequently, the handles shall be permitted to be located where they are safely operable and serviceable from a portable platform.

490.42 Interlocks — Interrupter Switches.
Interrupter switches equipped with stored energy mechanisms shall have mechanical interlocks to prevent access to the switch compartment unless the stored energy mechanism is in the discharged or blocked position.

490.43 Stored Energy for Opening.
The stored energy operator shall be permitted to be left in the uncharged position after the switch has been closed if a single movement of the operating handle charges the operator and opens the switch.

490.44 Fused Interrupter Switches.

(A) Supply Terminals.
The supply terminals of fused interrupter switches shall be installed at the top of the switch enclosure or, if the terminals are located elsewhere, the equipment shall have barriers installed so as to prevent persons from accidentally contacting energized parts or dropping tools or fuses into energized parts.

(B) Backfeed.
Where fuses can be energized by backfeed, a sign shall be placed on the enclosure door identifying this hazard.

(C) Switching Mechanism.
The switching mechanism shall be arranged to be operated from a location outside the enclosure where the operator is not exposed to energized parts and shall be arranged to open all ungrounded conductors of the circuit simultaneously with one operation. Switches shall be lockable in accordance with 110.25.

490.45 Circuit Breakers — Interlocks.

(A) Circuit Breakers.
Circuit breakers equipped with stored energy mechanisms shall be designed to prevent the release of the stored energy unless the mechanism has been fully charged.

(B) Mechanical Interlocks.
Mechanical interlocks shall be provided in the housing to prevent the complete withdrawal of the circuit breaker from the housing when the stored energy mechanism is in the fully charged position, unless a suitable device is provided to block the closing function of the circuit breaker before complete withdrawal.

490.46 Circuit Breaker Locking.
Circuit breakers shall be capable of being locked in the open position or, if they are installed in a drawout mechanism, that mechanism shall be capable of being locked in such a position that the mechanism cannot be moved into the connected position. In either case, the provision for locking shall be lockable in accordance with 110.25.

490.47 Switchgear Used as Service Equipment.
Switchgear installed as high-voltage service equipment shall include a ground bus for the connection of service cable shields and to facilitate the attachment of safety grounds for personnel protection. This bus shall be extended into the compartment where the service conductors are terminated. Where the compartment door or panel provides access to parts that can only be de-energized and visibly isolated by the serving utility, the warning sign required by 490.35(A) shall include a notice that access is limited to the serving utility or is permitted only following an authorization of the serving utility.

490.48 Substation Design, Documentation, and Required Diagram.
Design and Documentation.

Substations shall be designed by a qualified licensed professional engineer. Where components or the entirety of the substation are listed by a qualified electrical testing laboratory, documentation of internal design features subject to the listing investigation shall not be required. The design shall address but not be limited to the following topics, and the documentation of this design shall be made available to the authority having jurisdiction.

1. Clearances and exits
2. Electrical enclosures
3. Securing and support of electrical equipment
4. Fire protection
5. Safety ground connection provisions
6. Guarding live parts
7. Transformers and voltage regulation equipment
8. Conductor insulation, electrical and mechanical protection, isolation, and terminations
9. Application, arrangement, and disconnection of circuit breakers, switches, and fuses
10. Provisions for oil filled equipment
11. Switchgear
12. Surge arresters

Diagram.

A permanent, single-line diagram of the switchgear shall be provided in a readily visible location within the same room or enclosed area with the switchgear, and this diagram shall clearly identify interlocks, isolation means, and all possible sources of voltage to the installation under normal or emergency conditions and the marking on the switchgear shall cross-reference the diagram.

Exception: Where the equipment consists solely of a single cubicle or metal-enclosed unit substation containing only one set of high-voltage switching devices, diagrams shall not be required.

Part IV. Mobile and Portable Equipment

490.51 General.
(A) Covered.
The provisions of this part shall apply to installations and use of high-voltage power distribution and utilization equipment that is portable, mobile, or both, such as substations and switch houses mounted on skids, trailers, or cars; mobile shovels; draglines; cranes; hoists; drills; dredges; compressors; pumps; conveyors; underground excavators; and the like.
(B) Other Requirements.
The requirements of this part shall be additional to, or amendatory of, those prescribed in Articles 100 through 725 of this Code. Special attention shall be paid to Article 250.
(C) Protection.
Approved enclosures or guarding, or both, shall be provided to protect portable and mobile equipment from physical damage.
(D) Disconnecting Means.
Disconnecting means shall be installed for mobile and portable high-voltage equipment according to the requirements of Part VIII of Article 230 and shall disconnect all ungrounded conductors.

490.52 Overcurrent Protection.
Motors driving single or multiple dc generators supplying a system operating on a cyclic load basis do not require overload protection, provided that the thermal rating of the ac drive motor cannot be exceeded under any operating condition. The branch-circuit protective device(s) shall provide short-circuit and locked-rotor protection and shall be permitted to be external to the equipment.

490.53 Enclosures.
All energized switching and control parts shall be enclosed in grounded metal cabinets or enclosures. These cabinets or enclosures shall be marked DANGER — HIGH VOLTAGE — KEEP OUT and shall be locked so that only authorized and qualified persons can enter. The danger marking(s) or label(s) shall comply with 110.21(B). Circuit breakers and protective equipment shall have the operating means projecting through the metal cabinet or enclosure so these units can be reset without opening locked doors. With doors closed, safe access for normal operation of these units shall be provided.

490.54 Collector Rings.
The collector ring assemblies on revolving-type machines (shovels, draglines, etc.) shall be guarded to prevent accidental contact with energized parts by personnel on or off the machine.
490.55  Power Cable Connections to Mobile Machines.

A metallic enclosure shall be provided on the mobile machine for enclosing the terminals of the power cable. The enclosure shall include terminal connections to the machine frame for the equipment grounding conductor. Ungrounded conductors shall be attached to insulators or be terminated in approved high-voltage cable couplers (which include equipment grounding conductor connectors) of proper voltage and ampere rating. The method of cable termination used shall prevent any strain or pull on the cable from stressing the electrical connections. The enclosure shall have provision for locking so that only authorized and qualified persons may open it and shall be marked as follows:

DANGER — HIGH VOLTAGE — KEEP OUT.

The danger marking(s) or label(s) shall comply with 110.21(B).

490.56  High-Voltage Portable Cable for Main Power Supply.

Flexible high-voltage cable supplying power to portable or mobile equipment shall comply with Article 250 and Article 400, Part III.

Part V.  Electrode-Type Boilers

490.70  General.

The provisions of Part V shall apply to boilers operating over 1000 volts, nominal, in which heat is generated by the passage of current between electrodes through the liquid being heated.

490.71  Electrical Supply System.

Electrode-type boilers shall be supplied only from a 3-phase, 4-wire solidly grounded wye system, or from isolating transformers arranged to provide such a system. Control circuit voltages shall not exceed 150 volts, shall be supplied from a grounded system, and shall have the controls in the ungrounded conductor.

490.72  Branch-Circuit Requirements.

(A)  Rating.

Each boiler shall be supplied from an individual branch circuit rated not less than 100 percent of the total load.

(B)  Common-Trip Fault-Interrupting Device.

The circuit shall be protected by a 3-phase, common-trip fault-interrupting device, which shall be permitted to automatically reclose the circuit upon removal of an overload condition but shall not reclose after a fault condition.

(C)  Phase-Fault Protection.

Phase-fault protection shall be provided in each phase, consisting of a separate phase-overcurrent relay connected to a separate current transformer in the phase.

(D)  Ground Current Detection.

Means shall be provided for detection of the sum of the neutral conductor and equipment grounding conductor currents and shall trip the circuit-interrupting device if the sum of those currents exceeds the greater of 5 amperes or 7 1/2 percent of the boiler full-load current for 10 seconds or exceeds an instantaneous value of 25 percent of the boiler full-load current.

(E)  Grounded Neutral Conductor.

The grounded neutral conductor shall be as follows:

1. Connected to the pressure vessel containing the electrodes
2. Insulated for not less than 1000 volts
3. Have not less than the ampacity of the largest ungrounded branch-circuit conductor
4. Installed with the ungrounded conductors in the same raceway, cable, or cable tray, or, where installed as open conductors, in close proximity to the ungrounded conductors
5. Not used for any other circuit

490.73  Pressure and Temperature Limit Control.

Each boiler shall be equipped with a means to limit the maximum temperature, pressure, or both, by directly or indirectly interrupting all current flow through the electrodes. Such means shall be in addition to the temperature, pressure, or both, regulating systems and pressure relief or safety valves.

490.74  Bonding.

All exposed non–current-carrying metal parts of the boiler and associated exposed metal structures or equipment shall be bonded to the pressure vessel or to the neutral conductor to which the vessel is connected in accordance with 250.102, except the ampacity of the bonding jumper shall not be less than the ampacity of the neutral conductor.

Statement of Problem and Substantiation for Public Comment

The construction and requirements in this article appropriately describe installations of systems and equipment rated 2500 volts and above. Setting the scope at 1000 volts is inappropriate and constrains the extension of general low voltage product standards to higher voltages since the standards requirements intend to facilitate compliance with the NEC. The development of 1500 volt rated equipment such as circuit breakers and switches for photovoltaic systems demonstrate that the product standards can address the safety aspects...

associated with extending the voltage ratings to this level.

**Committee Statement**

Committee Action: Rejected  
Resolution: “High Voltage” is presently defined in Section 490.2 as “more than 1000 volts, nominal” as recommended by the Task Group on Over 600 Volts for the 2014 edition of the NEC. CMP 9 is not prepared to increase the level to 1500 volts which would further increase the upper limit of the “low voltage” range to 1500 volts. No technical substantiation has been provided in this Public Comment to warrant increasing the voltage level to “over 1500 volts”.

---
490.1 Scope.
This article covers the general requirements for equipment operating at more than 1000 volts, nominal.

Informational Note No. 1: See NFPA 70E-2015, Standard for Electrical Safety in the Workplace, for electrical safety requirements for employee workplaces.

Informational Note No. 2: For further information on hazard signs and labels, see ANSI Z535.4-2008, Product Signs and Safety Labels.

Committee Statement
Committee Action: Accepted
Resolution: SR-2417-NFPA 70-2015
Statement: This Informational Note is updated to reflect the latest version and title of the standard being referenced.
Statement of Problem and Substantiation for Public Comment

This Public Comment was developed by a Task Group assigned by the NEC Correlating Committee to: (1) resolve issues with actions taken by Code-making Panels 1 and 8 on proposals and comments in the 2014 NEC cycle relative to changing the voltage threshold in articles under their purview from 600 volts to 1000 volts, (2) address indoor and outdoor electrical substations, and (3) evaluate other higher voltage threshold requirements to be included relative to present trends. Members of the Task Group on Over 600 volts for this Public Comment included: Alan Manche; Donny Cook; Vince Saporita; Paul Barnhart; Eddie Guidry; Alan Peterson; David Kendall; Dave Mercier; Tim Pope; Roger McDaniel and Neil F. LaBrake, Jr.

PI-1535 was resolved with the following panel statement: “Submitter’s substantiation does not address removing the term “unit” from substation. Unit substations are understood to be an integrated line up of electrical equipment including a disconnect and optional overcurrent device rated above 1,000 Volts, a transformer with primary windings rated over 1,000 Volts and secondary windings rated less than or equal to or greater than 1,000 Volts, and secondary switchgear rated at the transformer’s secondary voltage. The substation is “unitized” as a single line up of metal enclosures, close coupled, with bus or insulated cable connections that are within the metal enclosures.”

It is acknowledged by the Task Group that the previously submitted substantiation lacked a thorough explanation of why the present term “unit substation” should read “substation” only. The High Voltage Task Group requests that Panel 9 reconsider the previous resolution based on the following additional information.

The term “unit substation” is currently found in four sections of the 2014 NEC: 110.31(B)(1), 490.30, 490.48(B)(5)Exception to (1), 490.48(C)Exception. The term “substation” is found in Art. 100 and was revised and moved to Part II (over 1000V) for the 2017 Code cycle.

The terms “substation” and “unit substation” can mean different things to different people depending on the voltage level, application and installation. And, since the term “unit substation” is not defined in Art. 100 or 490, but “substation” is, it is believed that removing the word “unit” would clarify the meaning of this term.

The Task Group requests that CMP 9 consider that product certification encompasses a much broader scope of the term “unit substation” than the description included in the panel statement in response to PI-1535. Without a separate, clear NEC definition in Article 490, that excludes other equipment which are currently listed by product certification bodies as “unit substations”, use of the term “unit substation” could lead to confusion for the user or inspection authority.

Please consider that UL Information Guide YEFR contains information for unit substations less than 600V. And, UL 1062 is the standard for low voltage unit substations, and contains the following definition: UNIT SUBSTATION - A transformer in combination with primary or secondary protective devices or devices used in a single enclosure.

Also consider, UL Information Guide YEFV contains information for unit substations for medium voltage applications. With respect to unit substations over 600V, the YEFV guide information discusses articulated and integral unit substations. The definitions of these two types of unit substations are included in the guide information as follows:

Articulated Unit Substations consist of a transformer section(s) together with an input section(s), an output section(s), or both. Transition sections may also be provided. These unit substations are designed, coordinated and assembled as multiple self-enclosed pieces of equipment intended for connection in the field.

Integral Unit Substations consist of a transformer section(s) together with an input section(s), an output section(s), or both. Transition sections may also be provided. These unit substations are designed, coordinated and assembled as a single self-enclosed piece of equipment. Sections may be shipped separately.

Note that the definition of articulated units does not state that they are a line-up of equipment that is close-coupled, but because it says “designed, coordinated, and assembled...” one might believe this means a line-up. But, conceivably they could be assembled in some other format (such as back to back, with a busway between them, or other configuration).

Integral unit substations are in a single enclosure or a single piece of equipment that may be multiple sections.

In addition to product certification misunderstandings, the term “unit substation” is used widely throughout the petrochemical industry to indicate that the substation is part of a process unit further adding to the confusion as to what the term “unit substation” means in Art. 490.

Removing the word “unit” will result in clearer and more accurate Code language for the user.

Committee Action: Rejected but see related SR
Resolution: SR-2418-NFPA 70-2015
Statement: The last sentence in 490.30 is redundant. The requirements in Part III apply as noted in the first sentence, and should not be modified for substations, power centers, or similar equipment of any design.
Statement of Problem and Substantiation for Public Comment

This Public Comment was developed by a Task Group assigned by the NEC Correlating Committee to: (1) resolve issues with actions taken by Code-making Panels 1 and 8 on proposals and comments in the 2014 NEC cycle relative to changing the voltage threshold in articles under their purview from 600 volts to 1000 volts, (2) address indoor and outdoor electrical substations, and (3) evaluate other higher voltage threshold requirements to be included relative to present trends. Members of the Task Group on Over 600 volts for this Public Comment included: Alan Manche; Donny Cook; Vince Saporita; Paul Barnhart; Eddie Guidry; Alan Peterson; David Kendall; Dave Mercier; Tim Pope; Roger McDaniel and Neil F. LaBrake, Jr.

The Task Group requests that Panel 9 reconsider the previous resolution based on the following additional information.

PI-1541 was resolved with the following panel statement: “Unit substations are understood to be an integrated line up of electrical equipment including a disconnect and optional overcurrent device rated above 1,000 Volts, a transformer with primary windings rated over 1,000 Volts and secondary windings rated less than or equal to or greater than 1,000 Volts, and secondary switchgear rated at the transformer’s secondary voltage. The substation is “unitized” as a single line up of metal enclosures, close coupled, with bus or insulated cable connections that are within the metal enclosures.”

The term “unit substation” is currently found in four sections of the 2014 NEC: 110.31(B)(1), 490.30, 490.48(B)(5)Exception to (1), 490.48(C)Exception. The term “substation” is found in Art. 100 and was revised and was moved to Part II (over 1000V) for the 2017 Code cycle.

The terms “substation” and “unit substation” can mean different things to different people depending on the voltage level, application and installation. And, since the term “unit substation” is not defined in Art. 100 or 490, but “substation” is, it is believed that removing the word “unit” would clarify the meaning of this term.

The Task Group requests that CMP 9 consider that product certification encompasses a much broader of the term “unit substation” than the description included in the panel statement in response to PI-1535. Without a separate, clear NEC definition in Article 490, that excludes other equipment which are currently listed by product certification bodies as “unit substations”, use of the term “unit substation” could lead to confusion for the user or inspection authority.

Please consider that UL Information Guide YEFR contains information for unit substations less than 600V. And, UL 1062 is the standard for low voltage unit substations, and contains the following definition: UNIT SUBSTATION - A transformer in combination with primary or secondary overcurrent protective devices or switching devices housed in a single enclosure.

Also consider, UL Information Guide YEFV contains information for unit substations for medium voltage applications. With respect to unit substations over 600V, the YEFV guide information discusses articulated and integral unit substations. The definitions of these two types of unit substations are included in the guide information as follows:

Articulated Unit Substations consist of a transformer section(s) together with an input section(s), an output section(s), or both. Transition sections may also be provided. These unit substations are designed, coordinated and assembled as multiple self-enclosed pieces of equipment intended for connection in the field.

Integral Unit Substations consist of a transformer section(s) together with an input section(s), an output section(s), or both. Transition sections may also be provided. These unit substations are designed, coordinated and assembled as a single self-enclosed piece of equipment. Sections may be shipped separately.

Note that the definition of articulated units does not state that they are a line-up of equipment that is close-coupled, but because it says “designed, coordinated, and assembled… one might believe this means a line-up. But, conceivably they could be assembled in some other format (such as back to back, with a busway between them, or other configuration).

Integral unit substations are in a single enclosure or a single piece of equipment that may be multiple sections.

In addition to product certification misunderstandings, the term “unit substation” is used widely throughout the petrochemical industry to indicate that the substation is part of a process unit further adding to the confusion as to what the term “unit substation” means in Art. 490.

Removing the word “unit” will result in clearer and more accurate Code language for the user.

Organization: Schneider Electric
Street Address: 
City: 
State: 
Zip: 
Submittal Date: Fri Sep 25 01:11:37 EDT 2015

Committee Statement

Committee Action: Rejected but held
Resolution: This exception is relying on the aspects of the unit substation to relieve the requirement for a single line diagram. The integral line up of metal enclosed equipment with a single primary disconnect, optional overcurrent device, transformer, and switching and overcurrent protection for the secondary side switchgear eliminates the need for interlocked switching, as there is only one primary power source available to the substation. Two unit substations in an electrical room are not the same as two standalone primary switches, transformers, and secondary switchgear assemblies that are cable connected. There is no guarantee as to how the stand alone devices are connected. A definition of "unit substation" should be considered in the next code cycle. To this end, CMP 9 has elected to hold this comment which guarantees its resubmittal in the next cycle. Furthermore, CMP 9 has created a task group to examine this issue.
**Public Comment No. 215-NFPA 70-2015 [New Section after 500.4(B)]**

Add Informational Note No. 7

Informational Note No. 7: For further information on ignition risks for other non-electrical hot surfaces that may be present and may need consideration for hazardous (classified) locations, see ANSI/API RP 2216-2010, *Ignition Risk of Hydrocarbon Liquids and Vapors by Hot Surfaces in the Open Air.*

**Statement of Problem and Substantiation for Public Comment**

PI 1503 was rejected with the following committee statement:

"Resolution: This informational note does not add value to the Code, and furthermore points to one of any number of documents that could be added and there is no higher value of this reference above any others."

I'm not sure if the panel realized at the time this was considered that, ISO 80079-36 Ed. 1.0: Explosive atmospheres - Part 36: Non-electrical equipment for explosive atmospheres — Basic method and requirements [6], and ISO 80079-37 Ed. 1.0: Explosive atmospheres - Part 37: Non-electrical equipment for explosive atmospheres — Non electrical type of protection constructional safety ‘c’, control of ignition source ‘b’, liquid immersion ‘k’ [7], have been revised and are in the process of being voted into acceptance.

These ISO standards will require a T-Code for ALL equipment, whether electrical or not. I realize ISO is an international document. But, given this issue, I feel like this PI was important. I ask the panel respectfully to reconsider the value of adding this reference.

Committee Action: Rejected  
Resolution: No new information from PI 1503. Same statement to resolve still applies. Resolution: This informational note does not add value to the Code, and furthermore points to one of any number of documents that could be added and there is no higher value of this reference above any others." Additionally, 500.4(B) states "Important information relating to topics covered in Chapter 5 may be found in other publications." This new informational note is not related to anything for the NEC, Chapter 5. Other mechanical topics/hazards are not addressed either.
Public Comment No. 249-NFPA 70-2015 [Section No. 500.4(B)]

(B) Reference Standards.

Important information relating to topics covered in Chapter 5 may be found in other publications.

Informational Note No. 1: Familiarity with the standards of the National Fire Protection Association (NFPA), the American Petroleum Institute (API), and the International Society of Automation (ISA), as well as relevant industrial experience, may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

Informational Note No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see NFPA 77-2014, Recommended Practice on Static Electricity; NFPA 780-2014, Standard for the Installation of Lightning Protection Systems; and API RP 2003-2008, Protection Against Ignitions Arising Out of Static Lightning and Stray Currents.

Informational Note No. 4: For further information on ventilation, see NFPA 30-2015, Flammable and Combustible Liquids Code; and ANSI/API RP 500-2012, Recommended Practice for Classification of Locations of Electrical Installations at Petroleum Facilities Classified as Class I, Division 1 and Division 2.

Informational Note No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, oil and gas well drilling land rigs, and skid mounted offiield equipment, see ANSI/API RP 14F-2013, Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class I, Division 1 and Division 2 Locations.

Informational Note No. 6: Portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, could potentially become an ignition source in hazardous (classified) locations. See ANSI/ISA-12.12.03-2011, Standard for Portable Electronic Products Suitable for Use in Class I and II, Class I Zone 2 and Class III, Division 1 and 2 Hazardous (Classified) Locations.

Statement of Problem and Substantiation for Public Comment

The Oil and Gas Well Drilling Land Rig Industry faces unique challenges as a result of their need for quick and easy mobility when rigging up and rigging down as the drilling land rig is transported overland between drill sites. In addition, the drilling rigs and the machines on them are subjected to significant movement, shaking, and vibration while drilling. Therefore these conditions require special consideration with regards to the selection and installation of electrical cables in hazardous (classified) locations.

Rigid conduit and Type MC-HL cable are not suitable for the application and in the absence of a consensus standard or recommended practice addressing the unique requirements for installing electric cables in hazardous (classified) locations on land rigs, the Oil and Gas Well Drilling Land Rig Industry has historically looked to consensus standards and practices in the Oil and Gas Well Drilling Offshore Industry for guidance; specifically API RP 14F entitled “Recommended Practice for Design, Installation, and Maintenance of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class 1, Division 1 and Division 2 Locations” and API RP 14FZ entitled “Recommended Practice for Design, Installation, and Maintenance of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class 1, Zone 0, Zone 1, and Zone 2 Locations.”

Adopting wiring methods from API RP 14F and API RP 14FZ, the Oil and Gas Well Drilling Land Rig Industry has historically and for over 30 years used IEEE-1580, Type P, marine shipboard cable to cable-up and interconnect the various machines and equipment that make up the drilling land rig. These cables may also be listed as UL-1309 Marine Shipboard Cable. The flexible and rugged IEEE-1580, Type P, marine shipboard cable is highly suitable for the oil and gas well drilling land rig application because of its ability to resist drilling muds that contain various chemicals, abrasives, and petroleum based additives as well as its ability to resist damage from vibration, shaking, and movement that occurs during the drilling process, and the rigors of rig-up and rig-down. They are also highly suited because of their ability to perform in extreme cold weather conditions in that they can pass a -40°F C cold bend test and a -35°C cold impact test. In addition to their flexibility and mechanical ruggedness as just described, the IEEE-1580, Type P, marine shipboard cable is rated 600/1000 volts or 2000 volts which makes it suitable for use on both AC and DC powered drilling rigs, has a maximum conductor temperature rating of 110°C, has a flexible tinned-copper stranded conductor that resists oxidation, and passes an IEEE 1202 vertical cable tray flame test. In addition, these flexible tinned-copper conductors are available in sizes like 444 Kcmil, 535 Kcmil,
646 Kcmil, and 777 Kcmil that are currently not recognized in NFPA 70. These cables are also available with a metallic basket-weave braided armor that effectively enhances their durability, provides crush, impact, and cut-through resistance, and is not prone to failure due to fatigue and cracking; properties that are very important in the drilling environment. Collectively, all of these properties and features which are required of both single-conductor and multi-conductor cable used on an oil and gas well drilling land rig are not available on any one cable type included in NFPA 70.

More specifically and per API RP 14F and API RP 14FZ; in Class 1, Division 1 and Class 1, Zone 1 hazardous (classified) locations, the Oil and Gas Well Drilling Land Rig Industry uses IEEE-1580, Type P, marine shipboard cable with a metallic basket-weave braided armor and outer polymeric sheath. The metallic basket-weave braided armor with outer polymeric sheath mechanically protects the cable from damage and yet provides the flexibility required for the application.

In addition, recommendations in API RP 14F and API RP 14FZ allow the use of unarmored IEEE-1580, Type P, marine shipboard cable in Class 1, Division 2 and Class 1, Zone 2 hazardous areas. Regardless, the specific location on the land rig is given engineering consideration relative to the cable’s vulnerability to mechanical damage. If the location in itself does not provide suitable mechanical protection or the addition of steel guards is not practical for the location, then armored and sheathed IEEE-1580, Type P, marine shipboard cable may be used.

Committee Statement

Committee Action: Rejected

Resolution: ANSI/API RP 14F-2013 is specific to fixed and floating off shore platforms and not relevant to “Oil and Gas Well Drilling Land Rigs”. Wiring methods on land based drilling rigs and related skid mounted equipment in the current NEC does not reflect the current practices utilizing flexible methods such as Type P cable. Panel recommends consideration of a task group consisting of CMP 14, CMP 6 and CMP 7 to allow wiring methods utilizing Type P cable (UL 1309) for this application.
Public Comment No. 107-NFPA 70-2015 [Section No. 500.5(A)]

(A) General.
Locations shall be classified depending on the properties of the flammable gas, flammable liquid–produced vapor, combustible liquid–produced vapors, combustible dusts, or fibers/flyings that may be present, and the likelihood that a flammable or combustible concentration or quantity is present. Each room, section, or area shall be considered individually in determining its classification. Where pyrophoric materials are the only materials used or handled, these locations are outside the scope of this article.

Informational Note No. 1: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in a reduced level of classification or in an unclassified location and, thus, to reduce the amount of special equipment required.

Refrigerant machinery rooms containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation that operates continuously or is initiated by a detection system that alarms at 1000 ppm may be classified as “unclassified” locations.

Rooms and refrigerated areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation that operates continuously or is initiated by a detection system that alarms at 1000 ppm may be classified as “unclassified” locations.

Informational Note No. 2: For further information regarding classification and ventilation of areas involving ammonia, see ANSI/ASHRAE 15 & 34 -2013, Safety Standard for Refrigeration Systems.

Statement of Problem and Substantiation for Public Comment

Correctly referenced ASHRAE 15 & 34 which an combined standard in informational note 2.

Informational Note No. 1: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in a reduced level of classification or in an unclassified location and, thus, to reduce the amount of special equipment required.

Refrigerant machinery rooms containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation that operates continuously or is initiated by a detection system that alarms at 1000 ppm may be classified as “unclassified” locations.

Rooms and refrigerated areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation that operates continuously or is initiated by a detection system that alarms at 1000 ppm may be classified as “unclassified” locations.

Informational Note No. 2: For further information regarding classification and ventilation of areas involving ammonia, see ANSI/ASHRAE 15-2013, Safety Standard for Refrigeration Systems.

Statement of Problem and Substantiation for Public Comment

Informational Note No. 1 provides a recommendation and design criteria. The NEC is not a design manual. Section 3.1.3 of the 2011 NEC Manual of Style states that Informational Notes shall not make recommendations, which this note does. Informational Note No. 2 is separated from other informational notes and should not be numbered.

Committee Action: Rejected
Resolution: The committee disagrees that Informational Note No. 1 provides a recommendation or design criteria. The wording “…it is frequently possible…” is not a recommendation, it is information only.
Public Comment No. 1580-NFPA 70-2015 [Section No. 500.5(A)]

(A) General.

Locations shall be classified depending on the properties of the flammable gas, flammable liquid–produced vapor, combustible liquid–produced vapors, combustible dusts, or fibers/flyings that may be present, and the likelihood that a flammable or combustible concentration or quantity is present. Each room, section, or area shall be considered individually in determining its classification. Where pyrophoric materials are the only materials used or handled, these locations are outside the scope of this article.

Informational Note No. 1: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in a reduced level of classification or in an unclassified location and, thus, to reduce the amount of special equipment required.

Refrigerant machinery rooms containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation that operates continuously or is initiated by a detection system that alarms at 1000 ppm may be classified as “unclassified” locations.

Rooms and refrigerated areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation that operates continuously or is initiated by a detection system that alarms at 1000 ppm may be classified as “unclassified” locations.

Statement of Problem and Substantiation for Public Comment

There is no logical reason for NFPA 70 to uniquely include specific provisions to regulate ammonia refrigeration in Section 500.5, given that there is no other material or application similarly regulated by this section. Any other material or application is governed by the general requirement. With the proposed change, classification of an area containing ammonia refrigeration equipment will be done in the same manner as any other material or application. The risk and mitigation measures must be evaluated using the NEC, NFPA 497 and other applicable codes/standards; and the area classification must established based on that evaluation, as stated in the first paragraph of 500.5. In the case of ammonia refrigeration, ANSI/ASHRAE 15 and ANSI/IIAR 2 provide detailed requirements covering the use of leak detection and ventilation systems that are too complex to duplicate into the NEC.

By approving this change, the NEC will eliminate overlap and conflict with these other ANSI standards, and by retaining the Informational Note pointing to these standards, users will be made aware of the special requirements and not be left with the impression that requirements for ammonia were simply dropped.

Submittal Date: Fri Sep 25 14:42:09 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3916-NFPA 70-2015
Statement: This change will correlate the NEC® with applicable ANSI standards that govern ammonia refrigeration systems, ANSI/IIAR 2 and ANSI/ASHRAE 15. Ammonia refrigeration machinery rooms are always required by these standards to have leak detection and ventilation systems and are designated as unclassified locations based on these mitigations. The NEC® is therefore being updated to reflect IIAR 2’s more restrictive 150 ppm ventilation trigger. Other areas where ammonia refrigeration equipment may be present, such as freezers, may have detection, alarms, ventilation or other mitigation measures approved by the AHJ, in accordance with ANSI/ASHRAE 15 and ANSI/IIAR 2 as a basis of assigning
an unclassified area designation. The provisions in these standards are too lengthy to warrant duplication in the NEC® for such a special situation. Informational Note 2 provides an appropriate pointer directing NEC® users to ANSI/ASHRAE 15 and ANSI/IAR 2 for guidance, and these are legally mandated reference standards in adopted fire and mechanical codes.
(4) Group D.
Flammable gas, flammable liquid–produced vapor, or combustible liquid–produced vapor mixed with air that may burn or explode, having either a maximum experimental safe gap (MESG) value greater than 0.75 mm or a minimum igniting current (MIC) ratio greater than 0.80. [497:3.3.5.1.4]

Informational Note No. 1: A typical Class I, Group D material is propane. [497:3.3.5.1.4]

Informational Note No. 2: For classification of areas involving ammonia atmospheres, see ANSI/ASHRAE 15 & 34 -2013, Safety Standard for Refrigeration Systems.

Statement of Problem and Substantiation for Public Comment
Referenced ASHRAE 15 & 34 which now a combined standard.

Public Comment No. 1415-NFPA 70-2015 [New Section after 500.6(B)(3)]

**Informational Note to (B)**
Insert the contents of 2013 NFPA 499, Table 5.2.2 here with appropriate abstract designations.

**Statement of Problem and Substantiation for Public Comment**

Table 5.2.2 used to be included in the NEC® Handbook but it was removed during the publication in the 2014 NEC(r) cycle, making the document less usable. Now, users have to have multiple documents open to do their work. During the First Draft meetings, the panel felt the material should be included in the next handbook and indicated as such but since the NFPA staff controls what is included in the handbook, there is no guarantee that this will occur. As such, I again ask that the panel just extract the table as recommended and restore the usability of the code. With the deletion of the duplicated definitions from this article, we can clearly allow space for this needed information.

Submittal Date: Fri Sep 25 10:39:45 EDT 2015

**Committee Statement**

Committee Action: Rejected
Resolution: The public input adds into the code additional information that is already found in NFPA 499. Including information to be available in one document, versus multiple documents, however beneficial, will only add to the size of the NEC and there is not enough of justification to include this text versus any other useful text already published in other referenced documents. The committee further agrees that this is useful information and should be reinstated in the handbook.
(3) Group G.
Atmospheres containing combustible dusts not included in Group E or Group F, including flour, grain, wood, plastic, and chemicals. [499:3.3.4.3]

Informational Note No. 1: For additional information on group classification of Class II materials, see NFPA 499-2013, Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas.

Informational Note No. 2: The explosion characteristics of air mixtures of dust vary with the materials involved. For Class II locations, Groups E, F, and G, the classification involves the tightness of the joints of assembly and shaft openings to prevent the entrance of dust in the dust-ignitionproof enclosure, the blanketing effect of layers of dust on the equipment that may cause overheating, and the ignition temperature of the dust. It is necessary, therefore, that equipment be identified not only for the class but also for the specific group of dust that will be present.

Informational Note No. 3: Certain dusts may require additional precautions due to chemical phenomena that can result in the generation of ignitable gases. See ANSI/IEEE C2-2012, National Electrical Safety Code, Section 127A, Coal Handling Areas.

Statement of Problem and Substantiation for Public Comment

Committee Statement

Committee Action: Rejected
Resolution: This is an ANSI approved standard.
Public Comment No. 214-NFPA 70-2015 [New Section after 500.7(J)]

**Factory-Sealed.**
Add new definition for "Factory-Sealed" equipment to existing section 500.2

**Factory-sealed.** Equipment such as contacts, ballasts, etc. encased from the factory with a molded casing that is explosionproof.

Informational note: Factory-sealed equipment is not hermetically sealed.

Statement of Problem and Substantiation for Public Comment

The committee resolution stated there is no need to define "factory sealed". I respectfully disagree. There are more engineers and designers in the petrochemical business that don't know the difference between a factory sealed contact and a hermetically sealed contact then you might imagine.

This situation is very similar to the one we had several code cycles back on CMP 11. There was a lot of confusion then between a Motor Circuit Protector vs. a Motor Short-Circuit protector. We added an informational note and clarified text that had been existent in the Code for many years and I still get comments today about how people didn't know the difference. I'd like to make the Code as user friendly as possible. I believe accepting this PI would help a lot of users and inspectors.

Please reconsider the PI referenced and this comment.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3922-NFPA 70-2015
Statement: The exception in 501.15(A)(1), Exception, item (c) was confusing and not clear that the users of the code should be looking for markings on identified equipment to confirm if a conduit seal is needed. The revised text clarifies what should be done. A definition for factory sealed equipment is thus not needed and adds no additional value.
(1) Equipment Provided with Threaded Entries for NPT-Threaded Conduit or Fittings.

For equipment provided with threaded entries for NPT-threaded conduit or fittings, listed conduit, listed conduit fittings, or listed cable fittings shall be used. All NPT-threaded conduit and fittings shall be threaded with a National (American) Standard Pipe Taper (NPT) thread.

NPT-threaded entries into explosionproof equipment shall be made up with at least five threads fully engaged.

Exception: For listed explosionproof equipment, joints with factory-threaded NPT entries shall be made up with at least four and one-half threads fully engaged.

Informational Note No. 1: Thread specifications for male NPT threads are located in ANSI/ASME B1.20.1-1983 2013, Pipe Threads, General Purpose (Inch).

(2) Equipment Provided with Threaded Entries for Metric-Threaded Fittings.
For equipment with metric-threaded entries, listed conduit fittings or listed cable fittings shall be used. Such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT-threaded fittings shall be provided with the equipment and shall be used for connection to conduit or NPT-threaded fittings.

Metric-threaded fittings installed into explosionproof equipment shall have a class of fit of at least 6g/6H and shall be made up with at least five threads fully engaged and wrenchtight.

Statement of Problem and Substantiation for Public Comment

To provide consistency with 500.8(E)(1) statement which reads: "NPT-threaded entries into explosionproof equipment shall be made up with at least five threads fully engaged."

Committee Statement

Committee Action: Accepted
Resolution: SR-3921-NFPA 70-2015
Statement: The requirement to be wrenchtight is already contained in 500.8(E).
(1) General.
In Class I, Division 1 locations, the wiring methods in (a) through (f) shall be permitted.
(a) Threaded rigid metal conduit or threaded steel intermediate metal conduit.
Exception: Type PVC conduit, Type RTRC conduit, and Type HDPE conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of 514.8, Exception No. 2, or 515.8(A). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.
(b) Type MI cable terminated with fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.
(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application.
Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.
(d) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application, and installed in accordance with the provisions of Article 727.
(e) Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in raceways in accordance with 501.10(A). These optical fiber cables shall be sealed in accordance with 501.15.
(f) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts, nominal, or less, and where protected from damage by location or a suitable guard, listed Type TC-ER-HL cable with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122 that is terminated with fittings listed for the location. Type TC-ER-HL cables shall be installed in accordance with the provisions of Article 336.10, including the restrictions of 336.10(7). For circuits over 150 volts to ground, nominal or 30 amps or more, the TC-ER-HL cables shall have a metallic shield encompassing the current carrying conductors to provide a reliable ground fault path that will ensure the operation of a ground fault protection device.

Statement of Problem and Substantiation for Public Comment
The introduction of TC-ER-HL Cable was new in 2014, but only for small diameter cables. The original problem was the fragile nature of MC-HL Cables less than 1 inch diameter for instrument connections. The metallic shield shall assure the activation of ground fault protection for circuits over 190 volts or 30 amps.

Committee Statement
Committee Action: Rejected
Resolution: There is no substantiation presented as to why the wiring method is "unsafe". If the TC-ER-HL has been installed in accordance with Article 336, it will be predominantly in a cable tray. Any extended run out of the tray is required to be protected by the location. If the cable is being damaged by the location, Section 110.11 may not have been correctly applied. There is no requirement that this wiring method be used in all installations. It provides another option. The restriction to industrial facilities, limitation on public access, and conditions of maintenance ensure that this will not be used in areas like filling stations that have public access. The shielded construction described is already permitted by UL 1277 and UL 2225, and in fact is often used for the twisted pair constructions.
(1) General.
In Class I, Division 1 locations, the wiring methods in (a) through (f) shall be permitted.

(a) Threaded rigid metal conduit or threaded steel intermediate metal conduit.
Exception: Type PVC conduit, Type RTRC conduit, and Type HDPE conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of 514.8, Exception No. 2, or 515.8(A). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.

(b) Type MI cable terminated with fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vapor tight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application.
Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

(d) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vapor tight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application, and installed in accordance with the provisions of Article 727.

(e) Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in raceways in accordance with 501.10(A). These optical fiber cables shall be sealed in accordance with 501.15.

(f) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type TC-ER-HL cable with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122, that is terminated with fittings listed for the location. Type TC-ER-HL cables shall be installed in accordance with the provisions of Article 336.10, including the restrictions of 336.10(7).

Statement of Problem and Substantiation for Public Comment

Remove section (f) in its entirety. No data was submitted to conclusively prove that a TC type cable is suitable for HL locations. Type MC-HL have served the industry well and have a proven track record for safety. The acceptance of a TC cable is a serious safety and fire concern.

Public Comment No. 1334-NFPA 70-2015 [Section No. 501.10(A)(1)]

(1) General.
In Class I, Division 1 locations, the wiring methods in (a) through (f) shall be permitted.

(a) Threaded rigid metal conduit or threaded steel intermediate metal conduit.
Exception: Type PVC conduit, Type RTRC conduit, and Type HDPE conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of 514.8, Exception No. 2, or 515.8(A). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.

(b) Type MI cable terminated with fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application.

Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

(d) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application, and installed in accordance with the provisions of Article 727.

(e) Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in raceways in accordance with 501.10(A). These optical fiber cables shall be sealed in accordance with 501.15.

(f) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts, nominal, or less, and where protected from damage by location or a suitable guard, listed Type TC-ER-HL cable with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122, that is terminated with fittings listed for the location. Type TC-ER-HL cables shall be installed in accordance with the provisions of Article 336.10, including the restrictions of 336.10(7).

Statement of Problem and Substantiation for Public Comment

Each revision cycle eases the requirements deemed necessary to ensure safe electrical installations in hazardous (classified) locations for industrial locations. The NEC does not define what is considered to be an industrial location. The proposed text does nothing to ensure that the installation is safe. Accidents can happen no matter who maintains the equipment. What ensures that electrical installations in an undefined "industrial" location is safer than in other facilities? Restricting public access does nothing to create a safer installation. A wiring method is either safe or it is unsafe; the type of facility makes no difference.

General.

In Class I, Division 1 locations, the wiring methods in (a) through (f) shall be permitted.

(a) Threaded rigid metal conduit or threaded steel intermediate metal conduit. Exception: Type PVC conduit, Type RTTRC conduit, and Type HDPE conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of 514.8, Exception No. 2, or 515.8(A). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non-current-carrying metal parts.

(b) Type MI cable terminated with fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaporlight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application.

Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

(d) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaporlight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application, and installed in accordance with the provisions of Article 727.

(e) Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in raceways in accordance with 501.10(A). These optical fiber cables shall be sealed in accordance with 501.15.

(f) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts, nominal, or less, and where protected from damage by location or a suitable guard, listed Type TC-ER-HL cable with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122, that is terminated with fittings listed for the location, Type TC-ER-HL cables shall be installed in accordance with the provisions of Article 336.10, including the restrictions of 336.10(7).

Statement of Problem and Substantiation for Public Comment

Including TC-ER-HL as a fixed wiring method in Class I Division 1 locations is a severe reduction in wiring method protection. Certain flammable gases or combustible vapors that are likely to be present in these locations are likely to affect the physical properties of the jacket material and penetrate into the cable. A nonmetallic jacket such as the types used for Type TC cable (including -ER and -HL designated cable) alone will not provide protection equal to metallic wiring methods against the hazards present in Class I Division 1 locations. All Class I Division 1 fixed wiring methods (except optical fiber products) presently require metallic raceways, MI cable or a gas/vaporlight metallic armor wiring method. These are proven wiring methods that maintain the appropriate level of protection and safety. Nonmetallic wiring methods in these locations are required to be encased in concrete, and similar protection should be required for TC-ER-HL if it is permitted.

(b) Type MI cable terminated with fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application.

Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

(d) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application, and installed in accordance with the provisions of Article 727.

(e) Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in raceways in accordance with 501.10(A). These optical fiber cables shall be sealed in accordance with 501.15.

(f) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts, nominal, or less, and where protected from damage by location or a suitable guard, listed Type TC-ER-HL cable with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122 that is terminated with fittings listed for the location. Type TC-ER-HL cables shall be installed in accordance with the provisions of Article 336.10, including the restrictions of 336.10(7).

Statement of Problem and Substantiation for Public Comment

As currently written, there are no restrictions in the use of non-armored cable in Division 1 locations which could compromise the level of safety at the location. The use of this cable in Division 1 locations would be suitable provided there are appropriate restrictions requiring a grounding shield above the voltage or current levels identified in the proposed text to ensure the operation of the circuit's ground fault protection device.

Statement of Problem and Substantiation for Public Comment

We do not support the addition of new (f) Type TC-ER-HL cable to the more robust wiring methods that are permitted in 501.10(A). This change would allow long runs of a cable with only a nonmetallic jacket which would not provide equivalent mechanical and fire protection as that afforded by metal conduit or armored cable.

It is unclear as to what types of connectors and/or couplings are suitable to transition from HDPE to threaded rigid metal conduit or threaded steel IMC prior to emerging from the ground. This needs to be determined before the wiring method is added to 501.10(A).
While PVC and RTRC type conduit are currently allowed when encased in concrete, HDPE is a flammable material and supports combustion.

The shielded construction described is already permitted by UL 1277 and UL 2225, and in fact is often used for the twisted pair constructions. For transitions to RMC or IMC, a threaded connector would be used in a similar manner to that of PVC or RTRC.
Public Comment No. 902-NFPA 70-2015 [ Sections 501.10(A)(1), 501.10(A)(2) ]

Sections 501.10(A)(1), 501.10(A)(2)

1. General.
   In Class I, Division 1 locations, the wiring methods in (a) through (f) shall be permitted.
   (a) Threaded rigid metal conduit or threaded steel intermediate metal conduit.
      Exception: Type PVC conduit, Type RTRC conduit, and Type HDPE conduit shall be permitted where encased in a concrete
      envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top
      of the conduit to grade. The concrete encasement shall be permitted to be omitted where subject to the provisions of 514.8.
      Exception No. 2, or 515.8(A). Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for
      the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An
      equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding
      of non–current-carrying metal parts.
   (b) Type MI cable terminated with fittings listed for the location. Type MI cable shall be installed and supported in a manner to
      avoid tensile stress at the termination fittings.
   (c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that
      only qualified persons service the installation, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a
      gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment
      grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application.
      Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.
   (d) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that
      only qualified persons service the installation, Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a
      gas/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with
      fittings listed for the application, and installed in accordance with the provisions of Article 727.
   (e) Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in
      raceways in accordance with 501.10(A). These optical fiber cables shall be sealed in accordance with 501.15.

2. Flexible Connections.
   Where necessary to employ flexible connections, as at motor terminals, the following shall be permitted:
   (1) Flexible fittings listed for the location, or
   (2) Flexible cord in accordance with the provisions of 501.140, terminated with cord connectors listed for the location, or
   (3) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts, nominal, or less, and where protected from damage by location or a suitable guard, listed Type TC-ER-HL cable with an overall jacket and a
      separate equipment grounding conductor(s) in accordance with 250.122, that is terminated with fittings listed for the location. Type TC-ER-HL cables shall be installed in accordance with the provisions of Article 336.10, including the
      restrictions of 336.10(7).

Statement of Problem and Substantiation for Public Comment

There is no technical substantiation for allowing the use of TC-ER-HL cables for use as a wiring method in Class 1, Division 1 locations.
In the submitter’s substantiation they ask the code-making panel to allow other technologies for these applications so NRTL’s can
develop the appropriate performance requirements. The requirements for these new technologies should be established prior to
allowing them to be approved for Class 1 Division 1 locations. Once the requirements are established and the new technologies prove
they can meet the requirements, then they could submit to update the code.

Submitter Information Verification

Submitter Full Name: JOSEPH ANDERSON
Organization: STEEL TUBE INSTITUTE
Street Address:
City:
State:
Zip:
Submittal Date: Mon Sep 21 19:11:03 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: There is no substantiation presented as to why the wiring method is “unsafe”. If the TC-ER-HL has been installed in accordance with Article 336, it will be predominantly in a cable tray. Any extended run out of the tray is required to be protected by the location. If the cable is being damaged by the location, Section 110.11 may not have been correctly applied. There is no requirement that this wiring method be used in all installations. It provides another option. The restriction to industrial facilities, limitation on public access, and conditions of maintenance ensure that this will not be used in areas like filling stations that have public access. The shielded construction described is already permitted by UL 1277 and UL 2225, and in fact is often used for the twisted pair constructions.
Public Comment No. 1061-NFPA 70-2015 [Section No. 501.10(B)(1)]

(1) General.
In Class I, Division 2 locations, all wiring methods permitted in 501.10(A) and the following wiring methods shall be permitted:

1. Rigid metal conduit (RMC) and intermediate metal conduit (IMC) with listed threadless fittings.
2. Electrical metallic tubing (EMT) with listed fittings.
3. Enclosed gasketed busways and enclosed gasketed wireways.
4. Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including installation in cable tray systems. The cable shall be terminated with listed fittings.
5. Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.
6. Type MC, MV, TC, or TC-ER cable, including installation in cable tray systems. The cable shall be terminated with listed fittings.
7. In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, listed reinforced thermosetting resin conduit (RTRC), factory elbows, and associated fittings, all marked with the suffix -XW, and Schedule 80 PVC conduit, factory elbows, and associated fittings shall be permitted.
8. Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in cable trays or any other raceway in accordance with 501.10(B). Optical fiber cables shall be sealed in accordance with 501.15.

Where seals are required for boundary conditions as defined in 501.15(A)(4), the Division 1 wiring method shall extend into the Division 2 area to the seal, which shall be located on the Division 2 side of the Division 1–Division 2 boundary.

Statement of Problem and Substantiation for Public Comment

The wiring method "EMT" is not equivalent to existing approved wiring methods for use in Class I, Division 2 locations. There were no adequate substantiations provided with this proposal. There is no evidence to justify the lowering of standards for wiring practices in Class I, Division 2 areas. There were no restrictions for fittings; this method would not provide the positive grounding provisions in order to provide a reasonable degree of safety in hazardous locations. An application of a seal fitting with this material would not comply with the requirements of Article 358.12. The physical properties of this method is not sufficient to be installed in hazardous location. The wall thickness of EMT is typically less than half on the other wiring methods identified in this section. This use of this wiring method in Class I, Division 2 locations will lower the standard of safety.

Resolution: SR-3901-NFPA 70-2015
Statement: Support requirements in 358.30 are not sufficient to prevent loss of grounding path in threadless couplings when located in Class I, Division 2 areas where uncontrolled arcing becomes an ignition source under fault conditions.
Public Comment No. 564-NFPA 70-2015 [Section No. 501.10(B)(1)]

(1) General.
In Class I, Division 2 locations, all wiring methods permitted in 501.10(A) and the following wiring methods shall be permitted:

(1) Rigid metal conduit (RMC) and intermediate metal conduit (IMC) with listed threadless fittings.
(2) Electrical metallic tubing (EMT) with listed fittings.
(3) Enclosed gasketed busways and enclosed gasketed wireways.
(5) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including installation in cable tray systems. The cable shall be terminated with listed fittings.
(6) Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.
(7) Type MC, MV, TC, or TC-ER cable, including installation in cable tray systems. The cable shall be terminated with listed fittings.
(8) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation and where metallic conduit does not provide sufficient corrosion resistance, listed reinforced thermosetting resin conduit (RTRC), factory elbows, and associated fittings, all marked with the suffix -XW, and Schedule 80 PVC conduit, factory elbows, and associated fittings shall be permitted.
(9) Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in cable trays or any other raceway in accordance with 501.10(B). Optical fiber cables shall be sealed in accordance with 501.15.
(10) Cablebus.

Where seals are required for boundary conditions as defined in 501.15(A)(4), the Division 1 wiring method shall extend into the Division 2 area to the seal, which shall be located on the Division 2 side of the Division 1–Division 2 boundary.

Statement of Problem and Substantiation for Public Comment

Requested action is to delete (2) EMT. There has been no data supplied to support EMT’s use in Class I hazardous classified locations and merely suggesting that other methods may or may not offer equivalent protection is highly subjective. We strongly suggest that CMP14 review this application in the comment stage and consider what data, if any, supports adding this use in Class I, hazardous classified locations. Note: Correct spelling of Metallic.

The wiring method “EMT” is not equivalent to any existing approved wiring methods for use in Class I, Division 2 locations. There were no adequate substantiations provided with this proposal. There is no evidence to justify the lowering of standards for wiring practices in Class I, Division 2 areas. There were no restrictions for fittings; this method would not provide the positive grounding provisions in order to provide a reasonable degree of safety in hazardous locations. An application of a seal fitting with this material may not comply with the requirements of Article 358.12. The physical properties of this method is not sufficient to be installed in hazardous location. The wall thickness of EMT is typically less than half on the other wiring methods identified in this section. EMT conduit installed in Division 2 public areas such as garages, gas stations, hangers, etc. could be subject to physical damage and result in an open ignition source in a hazardous location. This use of this wiring method in Class I, Division 2 locations will lower the current standard of safety.

(8) Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in cable trays or any other raceway in accordance with 501.10(B). Optical fiber cables shall be sealed in accordance with 501.15.
(9) Cablebus.

Where seals are required for boundary conditions as defined in 501.15(A)(4), the Division 1 wiring method shall extend into the Division 2 area to the seal, which shall be located on the Division 2 side of the Division 1–Division 2 boundary.

Statement of Problem and Substantiation for Public Comment

The wiring method “EMT” is not equivalent to any existing approved wiring methods for use in Class I, Division 2 locations as was suggested in the Public Input 2591. There were no technical substantiations provided with this Public Input. There is no evidence to justify the lowering of standards for wiring practices in Class I, Division 2 areas. Additionally, there were no restrictions for the use of this wiring method including no restrictions on the fittings. This method would not provide the positive grounding provisions in order to provide a reasonable degree of safety in hazardous locations with the grounding possibly being limited to a fittings single setscrew. The physical properties of this method is not sufficient to be installed in hazardous location. The wall thickness of EMT is typically less than half on the other conduit wiring methods identified in this section. EMT conduit installed in Division 2 public areas such as garages, gas stations, hangers, etc. could be subject to physical damage and corrosion resulting in an open ignition source in a hazardous location. This use of this wiring method in Class I, Division 2 locations will lower the current standard of safety in Classified Locations. The American Petroleum Institute, Subcommittee on Electrical Equipment is in full support of the removal of EMT as an acceptable wiring method in Class I, Div. 2 locations.

Resolution: SR-3901-NFPA 70-2015
| **Statement:** | Support requirements in 358.30 are not sufficient to prevent loss of grounding path in threadless couplings when located in Class I, Division 2 areas where uncontrolled arcing becomes an ignition source under fault conditions. |
Conduits installed in classified areas for future use that do not contain conductors must be effectively closed off to prevent the transmission of hazardous gasses to an unclassified area. A poured seal fitting may be used but is not required. Other approved means are acceptable such as a threaded conduit plug.

Conduits containing conductors must be sealed as required using approved seal fittings. Conductors must be contained within enclosures approved for the location.

Statement of Problem and Substantiation for Public Comment

Sites for compressed natural gas fueling are originally constructed for (1) gas compressor with future conduits installed for additional gas compressors. The compressor area is a poured concrete yard. There are several spare future use conduit stubs that are in this compressor yard. The compressor yard is a class 1 Div 2 area. The spare conduits extend to an unclassified area. Some inspectors insist that the conduits have poured seals even though there are no wires in the conduits. The transmission of hazardous gas from the classified area to an unclassified area can be eliminated by installing a threaded coupling with a threaded plug. This would function under the same principal as a poured seal. It is the threads of the conduit that mitigate the hazard not the sealing compound. Many general purpose inspectors that do not know the science of sealing in classified areas reject this method because the threaded plug is not a seal. Many future conduits must have the seals broken off and have the raceway system damaged or rendered unusable because of the misunderstandings of the inexperienced inspectors who can only read words and do not understand the intent of the code. This requirement is clarified to require seals where conductors are installed in future use conduit systems. This will eliminate the practice of inexperienced contractors inserting the future conductors back into the conduit and screwing a plug on the end of the future raceway system possibly damaging the conductors.

If a conduit used to transport flammable gas can be considered safely terminated with a threaded plug, an unused conduit system for electrical conductors should be as well.

Submittal Date: Wed Jul 22 17:10:18 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: Although a threaded plug is not identified for use as a boundary seal, there is no prohibition on its acceptance by the AHJ.
(2) Class I, Division 2 Boundary.

A conduit seal shall be required in each conduit run leaving a Class I, Division 2 location. The sealing fitting shall be permitted to be installed on either side of the boundary within 3.05 m (10 ft) of the boundary and it shall be designed and installed to minimize the amount of gas or vapor within the portion of the conduit installed in the Division 2 location that can be communicated beyond the seal. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Division 2 location, and a threaded connection shall be used at the sealing fitting. The conduit run between the conduit seal and the point at which the conduit leaves the Division 2 location shall contain no union, coupling, box, or other fitting except for a listed explosionproof reducer installed at the conduit seal. Such seals shall not be required to be explosionproof but shall be identified for the purpose of minimizing the passage of gases permitted under normal operating conditions and shall be accessible.

Informational Note: For further information, refer to ANSI/UL 514B-2012, Conduit, Tubing, and Cable Fittings.

Exception No. 1: Metal conduit that contains no unions, couplings, boxes, or fittings, that passes completely through a Division 2 location with no fittings installed within 300 mm (12 in.) of either side of the boundary, shall not be required to be sealed if the termination points of the unbroken conduit are located in unclassified locations.

Exception No. 2: Conduit systems terminating in an unclassified location where the metal conduit transitions to cable tray, cablebus, ventilated busway, or Type MI cable, or to cable not installed in any cable tray or raceway system, shall not be required to be sealed where passing from the Division 2 location into the unclassified location under the following conditions:

(1) The unclassified location is outdoors, or the unclassified location is indoors and the conduit system is entirely in one room.

(2) The conduits shall not terminate at an enclosure containing an ignition source in normal operation.

Exception No. 3: Conduit systems passing from an enclosure or a room that is unclassified, as a result of pressurization, into a Division 2 location shall not require a seal at the boundary.

Informational Note: For further information, refer to NFPA 496-2013, Standard for Purged and Pressurized Enclosures for Electrical Equipment.

Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a Division 2 location into an unclassified location if all of the following conditions are met:

(1) No part of the conduit system segment passes through a Division 1 location where the conduit segment contains unions, couplings, boxes, or fittings that are located within 300 mm (12 in.) of the Division 1 location.

(2) The conduit system segment is located entirely in outdoor locations.

(3) The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, and so forth, that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system.

(4) The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location.

(5) The conduit system segment is sealed at its entry to each enclosure or fitting located in the Division 2 location that contains terminals, splices, or taps.

<td>time_fill_incomming_J_boxes.JPG</td>
<td>The pic shows junction boxes in the class 1 Div 2 area. These Junction boxes feed the conduits that run in and out of the Class 1 Div 2 area. A seal is not required for the conduits entering these junction boxes in the class 1 div 2 area. A seal should not be required for a junction box that left the div 2 area for a few feet just because it has a splice. The seal would not be required if the class 1 div 2 area extended the length of the entire time fill system.</td>
<td></td>
</tr>
</tbody>
</table>
Statement of Problem and Substantiation for Public Comment

Delete the condition in 501.15(B)(2) exception 4 condition (5). Condition (5) requires a seal where a conduit enters a splice box in a Class 1 Div 2 area if a small length of conduit travels through an unclassified area. This would pertain to a compressed natural gas time fill installation. Fill posts are located approximately 25' apart. The fill post is a class 1 div 2 area for 5" in all directions. A conduit is run along the fill post route to provide an emergency stop button near the fill post. There are several fill posts in the time fill area. There may be up to 5 emergency stop buttons serving the fill posts. If the entire area was class 1 div 2 an initial boundary seal would be required for the emergency stop conduit and none required thereafter. Since the boundary of the div 2 area around the fill post is 5' the emergency stop conduit leaves and enters the div 2 area every time it nears a fill post. At each emergency stop button there are terminations at the contact blocks of the stop button. Contact blocks rated for a class 1 div 2 area are used in the button therefore a seal would not be required. With condition (5) a seal would be required because of the termination.

The entire installation is outdoor. The portion of conduit that leaves the class 2 area can be as short as 1'. It does not seem justified to ask for a seal on a splice or termination box that is in a class 1 div 2 area that would not normally be required, but is required now because the conduit left the div 2 area into an unclassified area for a short distance. Why is it required when it was not required for a complete class 1 div 2 area with no short sections of conduit that leave the area?

Statement of Problem and Substantiation for Public Comment

A seal is one of the most important parts of an explosion proof installation. Many contractors install and pour seals with little concern for the integrity of the compound installation. The manufacturer has very specific details on how to fill a seal. To only require the thickness of compound as an installation requirement does a disservice to the integrity of the installation.

Many contractors review the code prior to completing their work. Having a requirement that a manufacturers instructions must be followed specifically in this article is paramount in helping to insure the seal is properly installed. The manufacturer received the approval of their sealing system based on the instructions and their proper execution. The thickness of compound is important, but the proper sealing technique based on the instructions is important as well.

Committee Statement

Committee Action: Rejected
Resolution: This requirement already exists in Section 110.3(B) which is a general Section to Chapter 5 unless otherwise amended by Chapter 5.
Add new section 501.15(G):
501.15(G) Accessibility
Conduit and cable seals shall be accessible.

Statement of Problem and Substantiation for Public Comment

The committee Resolution reads: "A new accessibility requirement does not need to be added because the topic is already covered in 501.15(B)(2) and (C)(1)."

Please reconsider the comment and the related PI as 501.15(B)(2) and (C)(1) as quoted in the Resolution don't contain any verbiage related to accessibility of the conduit seal.

Submittal Date: Mon Jul 13 15:25:18 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: The proposed revision is not necessary as the requirement is already addressed. Section 501.15(B)(2) addresses Class I, Division 2 Boundary Seals and clearly requires that seals "shall be accessible". Section 501.15(C)(1) addresses Class I, Division 1 and 2 Sealing Fittings and clearly requires that seals "shall be accessible".
Public Comment No. 1346-NFPA 70-2015 [Section No. 501.105(A)(2)]

(2) Connections.

To facilitate replacement in industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, meters, instruments, and relays shall be permitted to be connected through Type TC-ER-HL cable by means of attachment plugs and receptacles, provided that all of the following conditions apply:

(1) Attachment plug and receptacle is listed for use in Class I, Division 1 locations and for use with TC-ER-HL cable.

(2) The attachment plug and receptacle is interlocked mechanically or electrically, or otherwise designed so that they cannot be separated when the contacts are energized and the contacts cannot be energized when the plug and socket outlet are separated.

(3) Type TC-ER-HL cable is listed for use in Class I, Division 1 locations.

(4) Type TC-ER-HL cable is installed in accordance with the provisions of Article 336, including the restrictions of 336.10(7).

(5) Only necessary receptacles are provided.

Statement of Problem and Substantiation for Public Comment

Each revision cycle eases the requirements deemed necessary to ensure safe electrical installations in hazardous (classified) locations for industrial locations. The NEC does not define what is considered to be an industrial location. The proposed text does nothing to ensure that the installation is safe. Accidents can happen no matter who maintains the equipment. What ensures that electrical installations in an undefined "industrial" location is safer than in other facilities? Restricting public access does nothing to create a safer installation. A wiring method is either safe or it is unsafe; the type of facility makes no difference.

(5) Only necessary receptacles are provided.

Statement of Problem and Substantiation for Public Comment

Identification that the plug and receptacle are for instrumentation is consistent with this section and reduces the potential for power and instrumentation receptacles to be confused possibly leading to instruments being exposed to excessive voltage. A possible source of ignition could then result in a Class I, Division 1 hazardous location. Item (5) has been deleted as it is ambiguous, unenforceable and provides nothing of value.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3925-NFPA 70-2015
Statement: List item (5) was not enforceable and was removed. New item (5) was added to clarify that receptacles shall not be interchangeable among different voltage levels. List item (4) was revised to comply with the NEC Style Manual.
(6) Connections.
To facilitate replacements, process control instruments shall be permitted to be connected through flexible cord, listed Type TC-ER cable, or Type TC-ER-HL cable, by means of attachment plug and receptacle, provided that all of the following conditions apply:

(1) Attachment plug and receptacle are listed for use in Class I, Division 2 locations and for use with flexible cords, Type TC-ER cable or Type TC-ER-HL cable as applicable, and shall be of the locking and grounding type.

Exception: A Class I, Division 2 listing is not required if the circuit is nonincendive field wiring.

(2) Unless the attachment plug and receptacle are interlocked mechanically or electrically, or otherwise designed so that they cannot be separated when the contacts are energized and the contacts cannot be energized when the plug and socket outlet are separated, a switch complying with 501.105(B)(2) is provided so that the attachment plug or receptacle is not depended on to interrupt current.

Exception: The switch is not required if the circuit is nonincendive field wiring.

(3) The flexible cord does not exceed 900 mm (3 ft) and is of a type listed for extra-hard usage or for hard usage if protected by location, if applicable.

(4) Type TC-ER cable or Type TC-ER-HL cable is installed in accordance with the provisions of Article 336, including the restrictions of 336.10(7), if applicable.

(5) Only necessary receptacles are provided.

(6) Unless the attachment plug and receptacle are interlocked mechanically or electrically, or otherwise designed so that they cannot be separated when the contacts are energized and the contacts cannot be energized when the plug and socket outlet are separated, the instrumentation receptacle carries a label warning against plugging or unplugging under load. The circuit has a maximum current of 3 amps.

Statement of Problem and Substantiation for Public Comment
This section is for instruments and relays and the current restriction for 3 Amp circuit should be maintained. Delete "if applicable" in (4), delete text in (5) as it adds no value, and delete (6) as the label exception introduces unnecessary hazards in a Division 2 location.

Committee Statement
Committee Action: Rejected but see related SR
Resolution: SR-3926-NFPA 70-2015
Statement: The section was rewritten to clarify the requirements. The request to remove the requirement for a warning label was rejected as there was inadequate substantiation in the comment. The limit for the circuit amperage was restored. List item (5) was not enforceable and was removed. New item (5) was added to clarify that receptacles shall not be interchangeable among different voltage levels.
(6) Connections.

To facilitate replacements, process control instruments shall be permitted to be connected through flexible cord, listed Type TC-ER cable, or Type TC-ER-HL cable, by means of attachment plug and receptacle, provided that all of the following conditions apply:

(1) Attachment plug and receptacle are listed for use in Class I, Division 2 locations and for use with flexible cords, Type TC-ER cable or Type TC-ER-HL cable as applicable, and shall be of the locking and grounding type.

Exception: A Class I, Division 2 listing is not required if the circuit is nonincendive field wiring.

(2) Unless the attachment plug and receptacle are interlocked mechanically or electrically, or otherwise designed so that they cannot be separated when the contacts are energized and the contacts cannot be energized when the plug and socket outlet are separated, a switch complying with 501.105(B)(2) is provided so that the attachment plug or receptacle is not depended on to interrupt current.

Exception: The switch is not required if the circuit is nonincendive field wiring.

(3) The flexible cord does not exceed 900 mm (3 ft) and is of a type listed for extra-hard usage or for hard usage if protected by location, if applicable.

(4) Type TC-ER cable or Type TC-ER-HL cable is installed in accordance with the provisions of Article 336, including the restrictions of 336.10(7), if applicable.

(5) Only necessary receptacles are provided.

(6) The attachment plug and receptacle are interlocked mechanically or electrically, or otherwise designed so that they cannot be separated when the contacts are energized and the contacts cannot be energized when the plug and socket outlet are separated.

The instrumentation receptacle carries a label warning against plugging or unplugging under load.

Statement of Problem and Substantiation for Public Comment

Safety within hazardous (classified) location should not be dependent on a person reading a warning sign to keep a connection from being broken under load.

Public Comment No. 117-NFPA 70-2015 [Section No. 501.125(B)]

(B) Class I, Division 2.

In Class I, Division 2 locations, motors, generators, and other rotating electrical machinery shall comply with the following:

1. Be identified for Class I, Division 2 locations, or
2. Be identified for Class I, Division 1 locations where sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices, either while starting or while running, are employed, or
3. Be open or nonexplosionproof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Division 2 location.
4. The exposed surface of space heaters used to prevent condensation of moisture during shutdown periods shall not exceed 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved when operated at rated voltage, and the maximum space heater surface temperature [based on a 40°C or higher marked ambient] shall be permanently marked on a visible nameplate mounted on the motor. Otherwise, space heaters shall be identified for Class I, Division 2 locations.
5. A sliding contact shaft bonding device used for the purpose of maintaining the rotor at ground potential, shall be permitted where the potential discharge energy is determined to be nonincendive for the application. The shaft bonding device shall be permitted to be installed on the inside or the outside of the motor.

Informational Note No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.

Informational Note No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitable gases or vapors is suspected, clean-air purging may be needed immediately prior to and during start-up periods.

Informational Note No. 3: For further information on the application of electric motors in Class I, Division 2 hazardous (classified) locations, see IEEE 1349-2011, IEEE Guide for the Application of Electric Motors in Class I, Division 2 and Class I, Zone 2 Hazardous (classified) Locations.

Informational Note No. 4: Reciprocating engine-driven generators, compressors, and other equipment installed in Class I, Division 2 locations may present a risk of ignition of flammable materials associated with fuel, starting, compression, and so forth, due to inadvertent release or equipment malfunction by the engine ignition system and controls. For further information on the requirements for ignition systems for reciprocating engines installed in Class I, Division 2 hazardous (classified) locations, see ANSI/UL 122001-2004, General Requirements for Electrical Ignition Systems for Internal Combustion Engines in Class I, Division 2 or Zone 2, Hazardous (classified) Locations.

Informational Note No. 5: For details of the evaluation process to determine incendivity, refer to Annex A and Figure A1 of UL SL11836 1836 Outline-2014, Outline of Investigation for Electric Motors and Generators for Use in Class I, Division 2, Class I, Zone 2, Class II, Division 2 and Zone 22 Hazardous (classified) Locations.

Public Comment No. 1804-NFPA 70-2015 [ Section No. 501.125(B) ]

(B) Class I, Division 2.

In Class I, Division 2 locations, motors, generators, and other rotating electrical machinery shall comply with the following:

1. Be identified for Class I, Division 2 locations, or
2. Be identified for Class I, Division 1 locations where sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices, either while starting or while running, are employed, or
3. Be open or nonexplosion-proof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Division 2 location.
4. The exposed surface of space heaters used to prevent condensation of moisture during shutdown periods shall not exceed 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved when operated at rated voltage, and the maximum space heater surface temperature [based on a 40°C or higher marked ambient] shall be permanently marked on a visible nameplate mounted on the motor. Otherwise, space heaters shall be identified for Class I, Division 2 locations.
5. A sliding contact shaft bonding device used for the purpose of maintaining the rotor at ground potential, shall be permitted where the potential discharge energy is determined to be nonincendive for the application. The shaft bonding device shall be permitted to be installed on the inside or the outside of the motor.

Informational Note No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.

Informational Note No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitable gases or vapors is suspected, clean-air purging may be needed immediately prior to and during start-up periods.

Informational Note No. 3: For further information on the application of electric motors in Class I, Division 2 hazardous (classified) locations, see IEEE 1349-2011, IEEE Guide for the Application of Electric Motors in Class I, Division 2 and Class I, Zone 2 Hazardous (Classified) Locations.

Informational Note No. 4: Reciprocating engine-driven generators, compressors, and other equipment installed in Class I, Division 2 locations may present a risk of ignition of flammable materials associated with fuel, starting, compression, and so forth, due to inadvertent release or equipment malfunction by the engine ignition system and controls. For further information on the requirements for ignition systems for reciprocating engines installed in Class I, Division 2 hazardous (classified) locations, see ANSI/UL 122001-2004, General Requirements for Electrical Ignition Systems for Internal Combustion Engines in Class I, Division 2 or Zone 2, Hazardous (Classified) Locations.

Informational Note No. 5: For details of the evaluation process to determine incendivity, refer to Annex A and Figure A1 of UL SU1836, Outline of Investigation for Electric Motors and Generators for Use in Class I, Division 2, Class I, Zone 2, Class II, Division 2 and Zone 22 Hazardous (Classified) Locations.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs the Panel review the proposed text to determine if the conjunction “or” is appropriate in items (1) and (2) and being inclusive of all proposed items (1), (2), and (3) with regard to a similar parallel format in 501.125(A).

Public Comment No. 565-NFPA 70-2015 [Section No. 501.125(B)]

(B) Class I, Division 2.

In Class I, Division 2 locations, motors, generators, and other rotating electrical machinery shall comply with the following:

(1) Be identified for Class I, Division 2 locations, or

(2) Be identified for Class I, Division 1 locations where sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices, either while starting or while running, are employed, or

(3) Be open or nonexplosionproof enclosed motors, such as squirrel-cage induction motors without brushes, switching mechanisms, or similar arc-producing devices that are not identified for use in a Class I, Division 2 location.

(4) The exposed surface of space heaters used to prevent condensation of moisture during shutdown periods shall not exceed 80 percent of the autoignition temperature in degrees Celsius of the gas or vapor involved when operated at rated voltage, and the maximum space heater surface temperature [based on a 40°C or higher marked ambient] shall be permanently marked on a visible nameplate mounted on the motor. Otherwise, space heaters shall be identified for Class I, Division 2 locations.

(5) A sliding contact shaft bonding device used for the purpose of maintaining the rotor at ground potential, shall be permitted where the potential discharge energy is determined to be nonincendive for the application. The shaft bonding device shall be permitted to be installed on the inside or the outside of the motor.

(6) Informational Note No. 1: It is important to consider the temperature of internal and external surfaces that may be exposed to the flammable atmosphere.

Informational Note No. 2: It is important to consider the risk of ignition due to currents arcing across discontinuities and overheating of parts in multisection enclosures of large motors and generators. Such motors and generators may need equipotential bonding jumpers across joints in the enclosure and from enclosure to ground. Where the presence of ignitable gases or vapors is suspected, clean-air purging may be needed immediately prior to and during start-up periods.

Informational Note No. 3: For further information on the application of electric motors in Class I, Division 2 hazardous (classified) locations, see IEEE 1349-2011, IEEE Guide for the Application of Electric Motors in Class I, Division 2 and Class I, Zone 2 Hazardous (Classified) Locations.

Informational Note No. 4: Reciprocating engine-driven generators, compressors, and other equipment installed in Class I, Division 2 locations may present a risk of ignition of flammable materials associated with fuel, starting, compression, and so forth, due to inadvertent release or equipment malfunction by the engine ignition system and controls. For further information on the requirements for ignition systems for reciprocating engines installed in Class I, Division 2 hazardous (classified) locations, see ANSI/UL 122001-2004, General Requirements for Electrical Ignition Systems for Internal Combustion Engines in Class I, Division 2 or Zone 2, Hazardous (Classified) Locations.

Informational Note No. 5: For details of the evaluation process to determine incendivity, refer to Annex A and Figure A1 of UL SU1836, Outline of Investigation for Electric Motors and Generators for Use in Class I, Division 2, Class I, Zone 2, Class II, Division 2 and Zone 22 Hazardous (Classified) Locations.

Statement of Problem and Substantiation for Public Comment

Requested action is to delete (5).

Nothing in the NEC prohibits a shaft bonding device that is approved for the location. See 501.125 (B) (3) which addresses an installation with no brushes. There is no documentation to suggest that all motors require this bond. No standard has been supplied to define how the potential discharge energy would be ‘nonincendive’. The term ‘application’ for which the requirement of nonincendive is not identified.

There seems to be a required evaluation for the shaft bonding device installed on a motor in a hazardous classified location of unknown mJ exposure and no method has been suggested as to how a user might evaluate this condition for a nonincendive condition.

Public Comment No. 1348-NFPA 70-2015 [Section No. 501.145(B)]

(B) Attachment Plugs.
Attachment plugs shall be of the type providing for connection to the equipment grounding conductor of a permitted flexible cord or cable and shall be identified for the location.

Statement of Problem and Substantiation for Public Comment

In the panel statement for the FR, the justification for the addition of "cable" was: "Type TC-ER-HL cable is a permissible wiring method in Class I, Division 1 locations, therefore Section 501.145(B) should be expanded to include the term "cable" along with "cord"."

However, TC-ER-HL is not a flexible cable. Flexible cables are covered in Article 400; TC cable (including TC cable rated with "-ER" and/or "-HL") is covered in Article 336. Flexible cords and flexible cables undergo entirely different evaluation processes than Chapter 3 wiring methods like TC cable, and the terminations and fittings are completely different.

City:
State:
Zip:
Submittal Date: Thu Sep 24 21:49:15 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: TC-ER-HL is a flexible wiring method. It is already recognized in Section 501.10(A)(2) for use where flexibility is required.
Public Comment No. 566-NFPA 70-2015 [Section No. 501.145(B)]

(B) Attachment Plugs.
Attachment plugs shall be of the type providing for connection to the equipment grounding conductor of a permitted flexible cord or cable and shall be identified for the location.

Exception: Receptacles and attachment plugs as provided in 501.105 (B)(6).

Statement of Problem and Substantiation for Public Comment

Action to add exception as shown.
The revision to 501.145(B) removed the exception which said “Receptacles and attachment plugs as provided in 501.105(B)(6).” Now, all attachment plugs are going to have to be “identified for the location”. The problem is that 501.105(B)(6) allowed (and still allows) receptacles that aren’t identified for the location if the circuit is non-incendive or if there is a switch installed and a label is applied such that the plug isn’t pulled under load. It looks like 501.145(B) is going to negate what was previously and currently allow to be done.

Submittal Date: Sat Sep 05 13:28:34 EDT 2015

Committee Statement
Committee Action: Rejected
Resolution: The requirements in Section 501.145(B) are specific to both Receptacles and Attachment Plugs in a Class I, Division 1 and Division 2 area. The requirements in Section 501.105(B) are specific to only the wire methods for meters, instruments, and relays in a Class I, Division 2 area. Plugs and Receptacles are not identified in terms of suitability for use with meters, instruments, and relays. The exception caused confusion as to what requirement in Section 501.145(B) was being amended by the exception. The exception was deleted, as the reference was incorrect and the original intent was unclear.
Public Comment No. 1343-NFPA 70-2015 [Section No. 502.10(A)(1)]

(1) General.
In Class II, Division 1 locations, the wiring methods in (1) through (5) shall be permitted:

(1) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.
(2) Type MI cable with termination fittings listed for the location. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.
(3) In industrial establishments with limited public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type MC-HL cable, listed for use in Class II, Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, a separate equipment grounding conductor(s) in accordance with 250.122, and provided with termination fittings listed for the location, shall be permitted.
(4) Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in raceways in accordance with 502.10(A). Optical fiber cables shall be sealed in accordance with 502.15.
(5) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, listed Type ITC-HL cable with a gas/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application, and installed in accordance with the provisions of Article 727.

Statement of Problem and Substantiation for Public Comment
Each revision cycle eases the requirements deemed necessary to ensure safe electrical installations in hazardous (classified) locations for industrial locations. The NEC does not define what is considered to be an industrial location. The proposed text does nothing to ensure that the installation is safe. Accidents can happen no matter who maintains the equipment. What ensures that electrical installations in an undefined "industrial" location is safer than in other facilities? Restricting public access does nothing to create a safer installation. A wiring method is either safe or it is unsafe; the type of facility makes no difference.

Committee Statement
Committee Action: Rejected
Resolution: No substantiation was provided as to why ITC-HL was "unsafe".
Public Comment No. 1406-NFPA 70-2015 [Section No. 502.125(B)]

(B) Class II, Division 2.

In Class II, Division 2 locations, motors, generators, and other rotating electrical equipment shall be totally enclosed nonventilated, totally enclosed pipe-ventilated, totally enclosed water-air-cooled, totally enclosed fan-cooled, or dust-ignitionproof, for which maximum full-load external temperature shall be in accordance with 500.8(D)(2) for normal operation when operating in free air (not dust blanketed) and shall have no external openings, such as unused conduit openings, drain holes, or through lifting lug holes.

Exception: If the authority having jurisdiction believes accumulations of nonconductive, nonabrasive dust will be moderate and if machines can be easily reached for routine cleaning and maintenance, the following shall be permitted to be installed:

1. Standard open-type machines without sliding contacts, centrifugal or other types of switching mechanism (including motor overcurrent, overloading, and overtemperature devices), or integral resistance devices
2. Standard open-type machines with such contacts, switching mechanisms, or resistance devices enclosed within dusttight housings without ventilating or other openings
3. Self-cleaning textile motors of the squirrel-cage type

Statement of Problem and Substantiation for Public Comment

As stated in Public Input 1591, motor manufacturers are changing bearing designs because they believe the standard bearings being used on IEEE 841 motors present an "external opening". As a result, the standard available motors aren't being sold for use in areas classified for dust, even though they meet the temperature code and are TEFC design. These IEEE 841 motors have bearings with Inpro® Seals, or bearing isolators, and are not an "external opening" that would credibly allow dust inside the motor in any significant way such that the motor internal would be an ignition source. This is not what was intended by the language inserted, here, and the committee should take this opportunity to clarify what is meant by "unused openings".

Resolution: SR-3928-NFPA 70-2015
Statement: Suitable means for sealing external openings have been addressed by the addition of list item (4) to the exception. The panel does not agree with the PC-1406 language that provides examples as to what are external openings, as these examples are not all inclusive.
Public Comment No. 1064-NFPA 70-2015 [Section No. 503.10(A)(1)]

(1) General.
In Class III, Division 1 locations, the wiring method shall be in accordance with (1) through (5):

(1) Rigid metal conduit, Type PVC conduit, Type RTRC conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways, or Type MC or MI cable with listed termination fittings.

(2) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including installation in cable tray systems. The cable shall be terminated with listed fittings.

(3) Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.

(4) Type MC, MI, MV, TC, or TC-ER cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed. The cable shall be terminated with listed fittings.

Exception to (4): Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the spacings required by 503.10(A)(1)(4).

(5) Cablebus.

Statement of Problem and Substantiation for Public Comment

The use of non-metallic jacked MV cable should not be allowed in Class III, Division 1 locations. The substantiation for this proposal provided by a cable manufacturer "MV cable is allowed for Class I, Division 2 locations and should be allowed in Class III, Division 1 and 2 locations, as well" in not sufficient to lower the current standard of safety. Type MV Cable should have a more robust jacket if it is to be allowed in a Division 1 location; possibly a MV-ER-HL that has increased crush and impact requirements.

Committee Statement

Committee Action: Rejected
Resolution: Insufficient substantiation provided for the removal of MV. It was also noted that the difference between Division 1 and Division 2 locations in Class III is quite different from Class I or Class II, as the only difference is related to "manufactured" and not a specific risk of release.
Public Comment No. 1379-NFPA 70-2015 [ Section No. 503.10(A)(1) ]

(1) General.
In Class III, Division 1 locations, the wiring method shall be in accordance with (1) through (5):

(1) Rigid metal conduit, Type PVC conduit, Type RTRC conduit, intermediate metal conduit, electrical metallic tubing, dusttight wireways, or Type MC or MI cable with listed termination fittings.

(2) Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including installation in cable tray systems. The cable shall be terminated with listed fittings.

(3) Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.

(4) Type MC, MI, MV TC, TC, or TC-ER cable installed in ladder, ventilated trough, or ventilated channel cable trays in a single layer, with a space not less than the larger cable diameter between the two adjacent cables, shall be the wiring method employed. The cable shall be terminated with listed fittings.

   Exception to (4): Type MC cable listed for use in Class II, Division 1 locations shall be permitted to be installed without the spacings required by. 503.10(A)(1)(4).

(5) Cablebus.

Statement of Problem and Substantiation for Public Comment

The use of non-shielded and non-metallic jacked MV cable should not be allowed in any Division 1 location including Class III, Division 1. The substantiation for this proposal provided by a cable manufacturer "MV cable is allowed for Class I, Division 2 locations and should be allowed in Class III, Division 1 and 2 locations, as well" is not sufficient technical substantiation to lower the current standard of safety. Type MV Cable should have a more robust jacket if it is to be allowed in a Division 1 location.

### Statement of Problem and Substantiation for Public Comment

Listings do not specify labeling as defined by the NEC, labeling requirements are determined by the certification organization.

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacturer remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL's Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Committee Statement

Committee Action: Rejected

Resolution: “Listed” and “labeled” are defined separately in Art. 100. Listed is the correct term. Requirements for product listing, to include the affixing of a certification label or mark are specified by certification organizations. Whereas the two certification organizations cited do require listed products to bear a certification mark, these requirements may vary between other organizations.
505.2 Definitions.

Encapsulation "m".
Type of protection where electrical parts that could ignite an explosive atmosphere by either sparking or heating are enclosed in a compound in such a way that this explosive atmosphere cannot be ignited.

Informational Note No. 2: Encapsulation is designated type of protection "ma" for use in Zone 0 locations. Encapsulation is designated type of protection "m" or "mb" for use in Zone 1 locations. Encapsulation is designated type of protection "mc" for use in Zone 2 locations.

Flameproof "d".
Type of protection where the enclosure will withstand an internal explosion of a flammable mixture that has penetrated into the interior, without suffering damage and without causing ignition, through any joints or structural openings in the enclosure, of an external explosive gas atmosphere consisting of one or more of the gases or vapors for which it is designed.

Increased Safety "e".
Type of protection applied to electrical equipment that does not produce arcs or sparks in normal service and under specified abnormal conditions, in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.

Informational Note: See ANSI/ISA-60079-7-2009, Explosive Atmospheres — Part 7: Equipment protection by increased safety "e"; and ANSI/UL 60079-7-2009, Electrical Apparatus for Explosive Gas Atmospheres — Part 7: Increased Safety "e".

Intrinsic Safety "i".
Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

Informational Note No. 2: Intrinsic safety is designated type of protection "ia" for use in Zone 0 locations. Intrinsic safety is designated type of protection "ib" for use in Zone 1 locations. Intrinsic safety is designated type of protection "ic" for use in Zone 2 locations.

Informational Note No. 3: Intrinsically safe associated apparatus, designated by [ia], [ib], or [ic], is connected to intrinsically safe apparatus ("ia", "ib", or "ic", respectively) but is located outside the hazardous (classified) location unless also protected by another type of protection (such as flameproof).

Oil Immersion "o".
Type of protection where electrical equipment is immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

Powder Filling "q".
Type of protection where electrical parts capable of igniting an explosive atmosphere are fixed in position and completely surrounded by filling material (glass or quartz powder) to prevent the ignition of an external explosive atmosphere.

Pressurization “p”:
Type of protection for electrical equipment that uses the technique of guarding against the ingress of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere.

Type of Protection “n”:
Type of protection where electrical equipment, in normal operation, is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3917-NFPA 70-2015
Statement: Standards referenced in the informational notes have been updated and the current revisions of these documents have been shown. In cases where the ANSI/UL standard has moved to a new edition and no corresponding ANSI/ISA document is available, the ANSI/ISA reference has been eliminated to ensure that we don’t introduce two different editions of the same standard in these references. IEC 60079-13-2010 was not adopted in the US and it is confusing to be referring to it in this informational note because this standard is not formally adopted.
505.4  General.

(A)  Documentation for Industrial Occupancies.

All areas in industrial occupancies designated as hazardous (classified) locations shall be properly documented. This documentation shall be available to those authorized to design, install, inspect, maintain, or operate electrical equipment at the location.

Informational Note No. 2: Where gas detection equipment is used as a means of protection in accordance with 505.8(i)(1), (i)(2), or (i)(3), the documentation typically includes the type of detection equipment, its listing, installation location(s), alarm and shutdown criteria, and calibration frequency.

(B)  Reference Standards.

Important information relating to topics covered in Chapter 5 may be found in other publications.

Informational Note No. 1: It is important that the authority having jurisdiction be familiar with recorded industrial experience as well as with standards of the National Fire Protection Association (NFPA), the American Petroleum Institute (API), the International Society of Automation (ISA), and the International Electrotechnical Commission (IEC) that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

Informational Note No. 3: For further information on protection against static electricity and lightning hazards in hazardous (classified) locations, see NFPA 77-2014, Recommended Practice on Static Electricity; NFPA 780-2014, Standard for the Installation of Lightning Protection Systems; and API RP 2003-2008, Protection Against Ignitions Arising Out of Static Lightning and Stray Currents.

Informational Note No. 4: For further information on ventilation, see NFPA 30-2015, Flammable and Combustible Liquids Code, and ANSI/API RP 505-1997, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, or Zone 2.

Informational Note No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, see ANSI/API RP 14FZ-2013, Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class I, Zone 0, Zone 1, and Zone 2 Locations.

Informational Note No. 6: For further information on the installation of electrical equipment in hazardous (classified) locations in general, see IEC 60079-14-2013, Electrical apparatus for explosive gas atmospheres — Part 14: Electrical installations in explosive gas atmospheres (other than mines), and IEC 60079-16-1990, Electrical apparatus for explosive gas atmospheres — Part 16: Artificial ventilation for the protection of analyzer(s) houses.

Informational Note No. 7: For further information on application of electrical equipment in hazardous (classified) locations in general, see ANSI/ISA-60079-0 (12.00.01)-2013, Explosive Atmospheres — Part 0: Equipment — General Requirements; ANSI/ISA-12.01.01-1999 2013, Definitions and Information Pertaining to Electrical Apparatus Electrical Equipment in Hazardous (Classified) Locations; and ANSI/UL 60079-0:2013, Electrical Apparatus for Explosive Gas Atmospheres — Part 0: General Requirements.

Informational Note No. 8: Portable or transportable equipment having self-contained power supplies, such as battery-operated, could potentially become an ignition source in hazardous (classified) locations. See ANSI/ISA-12.12.03-2011, Standard for Portable Electronic Products Suitable for Use in Class I and II, Division 2, Class I Zone 2 and Class III, Division 1 and 2 Hazardous (Classified) Locations.

Informational Note No. 9: For additional information concerning the installation of equipment utilizing optical emissions technology (such as laser equipment) that could potentially become an ignition source in hazardous (classified) locations, see ANSI/ISA-60079-28 (12.21.02)-2013, Explosive Atmospheres — Part 28: Protection of equipment and transmission systems using optical radiation.
Referenced current editions, and names of standards.

Informational Note No. 5: For further information on electrical systems for hazardous (classified) locations on offshore oil and gas producing platforms, oil and gas well drilling land rigs, and skid mounted oilfield equipment, see ANSI/API RP 14FZ-2013, Recommended Practice for Design and Installation of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class I, Zone 0, Zone 1, and Zone 2 Locations.

Informational Note No. 6: For further information on the installation of electrical equipment in hazardous (classified) locations in general, see IEC 60079-14-2013, Electrical apparatus for explosive gas atmospheres — Part 14: Electrical installations in explosive gas atmospheres (other than mines), and IEC 60079-16-1990, Electrical apparatus for explosive gas atmospheres — Part 16: Artificial ventilation for the protection of analyzer(s) houses.

Informational Note No. 7: For further information on application of electrical equipment in hazardous (classified) locations in general, see ANSI/ISA-60079-9-0 (12.00.01)-2013, Explosive Atmospheres — Part 0: Equipment — General Requirements; ANSI/ISA-12.12.01-1999, Definitions and Information Pertaining to Electrical Apparatus in Hazardous (Classified) Locations; and ANSI/UL 60079-0:2013, Electrical Apparatus for Explosive Gas Atmospheres — Part 0: General Requirements.

Informational Note No. 8: Portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, could potentially become an ignition source in hazardous (classified) locations. See ANSI/ISA-12.12.03-2011, Standard for Portable Electronic Products Suitable for Use in Class I and II, Division 2, Class I Zone 2 and Class III, Division 1 and 2 Hazardous (Classified) Locations.

Informational Note No. 9: For additional information concerning the installation of equipment utilizing optical emissions technology (such as laser equipment) that could potentially become an ignition source in hazardous (classified) locations, see ANSI/ISA-60079-28 (12.21.02)-2013, Explosive Atmospheres — Part 28: Protection of equipment and transmission systems using optical radiation.

Statement of Problem and Substantiation for Public Comment

The Oil and Gas Well Drilling Land Rig Industry faces unique challenges as a result of their need for quick and easy mobility when rigging up and rigging down as the drilling land rig is transported overland between drill sites. In addition, the drilling rigs and the machines on them are subjected to significant movement, shaking, and vibration while drilling. Therefore these conditions require special consideration with regards to the selection and installation of electrical cables in hazardous (classified) locations.

Rigid conduit and Type MC-HL cable are not suitable for the application and in the absence of a consensus standard or recommended practice addressing the unique requirements for installing electric cables in hazardous (classified) locations on land rigs, the Oil and Gas Well Drilling Land Rig Industry has historically looked to consensus standards and practices in the Oil and Gas Well Drilling Offshore Industry for guidance; specifically API RP 14F entitled “Recommended Practice for Design, Installation, and Maintenance of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class 1, Division 1 and Division 2 Locations” and API RP 14FZ entitled “Recommended Practice for Design, Installation, and Maintenance of Electrical Systems for Fixed and Floating Offshore Petroleum Facilities for Unclassified and Class 1, Zone 0, Zone 1, and Zone 2 Locations.”

Adopting wiring methods from API RP 14F and API RP 14FZ, the Oil and Gas Well Drilling Land Rig Industry has historically and for
over 30 years used IEEE-1580, Type P, marine shipboard cable to cable-up and interconnect the various machines and equipment that make up the drilling land rig. These cables may also be listed as UL-1309 Marine Shipboard Cable. The flexible and rugged IEEE-1580, Type P, marine shipboard cable is highly suitable for the oil and gas well drilling land rig application because of its ability to resist drilling muds that contain various chemicals, abrasives, and petroleum based additives as well as its ability to resist damage from vibration, shaking, and movement that occurs during the drilling process, and the rigors of rig-up and rig-down. They are also highly suited because of their ability to perform in extreme cold weather conditions in that they can pass a -40\(^\circ\)C cold bend test and a -35\(^\circ\)C cold impact test. In addition to their flexibility and mechanical ruggedness as just described, the IEEE-1580, Type P, marine shipboard cable is rated 600/1000 volts or 2000 volts which makes it suitable for use on both AC and DC powered drilling rigs, has a maximum conductor temperature rating of 110\(^\circ\)C, has a flexible tinned-copper stranded conductor that resists oxidation, and passes an IEEE 1202 vertical cable tray flame test. In addition, these flexible tinned-copper conductors are available in sizes like 444 Kcmil, 535 Kcmil, 646 Kcmil, and 777 Kcmil that are currently not recognized in NFPA 70. These cables are also available with a metallic basket-weave braided armor that effectively enhances their durability, provides crush, impact, and cut-through resistance, and is not prone to failure due to fatigue and cracking; properties that are very important in the drilling environment. Collectively, all of these properties and features which are required of both single-conductor and multi-conductor cable used on an oil and gas well drilling land rig are not available on any one cable type included in NFPA 70.

More specifically and per API RP 14F and API RP 14FZ; in Class 1, Division 1 and Class 1, Zone 1 hazardous (classified) locations, the Oil and Gas Well Drilling Land Rig Industry uses IEEE-1580, Type P, marine shipboard cable with a metallic basket-weave braided armor and outer polymeric sheath. The metallic basket-weave braided armor with outer polymeric sheath mechanically protects the cable from damage and yet provides the flexibility required for the application.

In addition, recommendations in API RP 14F and API RP 14FZ allow the use of unarmored IEEE-1580, Type P, marine shipboard cable in Class 1, Division 2 and Class 1, Zone 2 hazardous areas. Regardless, the specific location on the land rig is given engineering consideration relative to the cable’s vulnerability to mechanical damage. If the location in itself does not provide suitable mechanical protection or the addition of steel guards is not practical for the location, then armored and sheathed IEEE-1580, Type P, marine shipboard cable may be used.

**Committee Statement**

Committee Action: Rejected but held  
Resolution: ANSI/API RP 14FZ-2013 is specific to fixed and floating off shore platforms and not relevant to “Oil and Gas Well Drilling Land Rigs”. Wiring methods on land based drilling rigs and related skid mounted equipment in the current NEC does not reflect the current practices utilizing flexible methods such as Type P cable. Panel recommends consideration of a task group consisting of CMP 14, CMP 6 and CMP 7 to allow wiring methods utilizing Type P cable (UL 1309) for this application.

505.5 - Classification of Locations.

(A) - Classification of Locations.

Locations shall be classified depending on the properties of the flammable gases, flammable liquid–produced vapors, combustible liquid–produced vapors, combustible dusts, or fibers/flyings that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Each room, section, or area shall be considered individually in determining its classification. Where pyrophoric materials are the only materials used or handled, these locations are outside the scope of this article.

Informational Note No. 1: See 505.7 for restrictions on area classification.

Informational Note No. 2: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in reduced level of classification or in an unclassified location and, thus, to reduce the amount of special equipment required.

Refrigerant machinery rooms containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation that operates continuously or is initiated by a detection system that alarms at 1000 ppm may be classified as “unclassified” locations.

Rooms and refrigerated areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation that operates continuously or is initiated by a detection system that alarms at 1000 ppm may be classified as “unclassified” locations.

Informational Note: For further information regarding classification and ventilation of areas involving ammonia, see ANSI/ASHRAE 15, 15, & 34 -2013, Safety Standard for Refrigeration Systems.

(B) - Class I, Zone 0, 1, and 2 Locations.

Class I, Zone 0, 1, and 2 locations are those in which flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures. Class I, Zone 0, 1, and 2 locations shall include those specified in 505.5(B)(1), (B)(2), and (B)(3).

(1) - Class I, Zone 0.

A Class I, Zone 0 location is a location in which

1. Ignitible concentrations of flammable gases or vapors are present continuously, or

2. Ignitible concentrations of flammable gases or vapors are present for long periods of time.

Informational Note No. 1: As a guide in determining when flammable gases or vapors are present continuously or for long periods of time, refer to ANSI/API RP 505-1997, Recommended Practice for Classification of Locations for Electrical Installations of Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2; ANSI/ISA-TR12.24.01-1998 (IEC 60079-10 Mod), Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2; IEC 60079-10-1995, Electrical apparatus for explosive gas atmospheres - classifications of hazardous areas; and 1-2008, Explosive Atmospheres - Part 10-1: Classification of Areas - Explosive Gas Atmospheres; and Model Code of Safe Practice Part 15: Area Classification Code for Petroleum Installations, Model Code, Part 15, Institute of Petroleum Handling Flammable Fluids, 3rd Edition, 2005, Energy Institute.

Informational Note No. 2: This classification includes locations inside vented tanks or vessels that contain volatile flammable liquids; inside inadequately vented spraying or coating enclosures, where volatile flammable solvents are used; between the inner and outer roof sections of a floating roof tank containing volatile flammable liquids; inside open vessels, tanks and pits containing volatile flammable liquids; the interior of an exhaust duct that is used to vent ignitible concentrations of gases or vapors; and inside inadequately ventilated enclosures that contain normally venting instruments utilizing or analyzing flammable fluids and venting to the inside of the enclosures.
Class I, Zone 1.

A Class I, Zone 1 location is a location

1. In which ignitable concentrations of flammable gases or vapors are likely to exist under normal operating conditions; or
2. In which ignitable concentrations of flammable gases or vapors may exist frequently because of repair or maintenance operations or because of leakage; or
3. In which equipment is operated or processes are carried on, of such a nature that equipment breakdown or faulty operations could result in the release of ignitable concentrations of flammable gases or vapors and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition; or
4. That is adjacent to a Class I, Zone 0 location from which ignitible concentrations of vapors could be communicated, unless communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

Informational Note No. 1: Normal operation is considered the situation when plant equipment is operating within its design parameters. Minor releases of flammable material may be part of normal operations. Minor releases include the releases from mechanical packings on pumps. Failures that involve repair or shutdown (such as the breakdown of pump seals and flange gaskets, and spillage caused by accidents) are not considered normal operation.

Informational Note No. 2: This classification usually includes locations where volatile flammable liquids or liquefied flammable gases are transferred from one container to another. In areas in the vicinity of spraying and painting operations where flammable solvents are used; adequately ventilated drying rooms or compartments for evaporation of flammable solvents; adequately ventilated locations containing fat and oil extraction equipment using volatile flammable solvents; portions of cleaning and dyeing plants where volatile flammable liquids are used; adequately ventilated gas generator rooms and other portions of gas manufacturing plants where flammable gas may escape; inadequately ventilated pump rooms for flammable gas or for volatile flammable liquids; the interiors of refrigerators and freezers in which volatile flammable materials are stored in the open, lightly stoppered, or in easily ruptured containers; and other locations where ignitable concentrations of flammable vapors or gases are likely to occur in the course of normal operation but not classified Zone 0.

Class I, Zone 2.

A Class I, Zone 2 location is a location

1. In which ignitable concentrations of flammable gases or vapors are not likely to occur in normal operation and, if they do occur, will exist only for a short period; or
2. In which volatile flammable liquids, flammable gases, or flammable vapors are handled, processed, or used but in which the liquids, gases, or vapors normally are confined within closed containers of closed systems from which they can escape, only as a result of accidental rupture or breakdown of the containers or system, or as a result of the abnormal operation of the equipment with which the liquids or gases are handled, processed, or used; or
3. In which ignitable concentrations of flammable gases or vapors normally are prevented by positive mechanical ventilation but which may become hazardous as a result of failure or abnormal operation of the ventilation equipment; or
4. That is adjacent to a Class I, Zone 1 location, from which ignitible concentrations of flammable gases or vapors could be communicated, unless such communication is prevented by adequate positive-pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

Informational Note: The Zone 2 classification usually includes locations where volatile flammable liquids or flammable gases or vapors are used but which would become hazardous only in case of an accident or of some unusual operating condition.

Statement of Problem and Substantiation for Public Comment

Referenced ASHRAE STD 15 & AS4 which is a combined standard in the informational note to 505.5(A).

In 505.5(B)(1)(2) informational note 1 referenced current editions of two of the standards.

Public Comment No. 1624-NFPA 70-2015 [Section No. 505.5(A)]

(A) Classification of Locations

Locations shall be classified depending on the properties of the flammable gases, flammable liquid–produced vapors, combustible liquid–produced vapors, combustible dusts, or fibers/flyings that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Each room, section, or area shall be considered individually in determining its classification. Where pyrophoric materials are the only materials used or handled, these locations are outside the scope of this article.

Informational Note No. 1: See 505.7 for restrictions on area classification.

Informational Note No. 2: Through the exercise of ingenuity in the layout of electrical installations for hazardous (classified) locations, it is frequently possible to locate much of the equipment in reduced level of classification or in an unclassified location and, thus, to reduce the amount of special equipment required.

Refrigerant machinery rooms containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation that operates continuously or is initiated by a detection system that alarms at 1000 ppm may be classified as “unclassified” locations.

Rooms and refrigerated areas containing ammonia refrigeration systems that are equipped with adequate mechanical ventilation that operates continuously or is initiated by a detection system that alarms at 1000 ppm may be classified as “unclassified” locations.

Statement of Problem and Substantiation for Public Comment

There is no logical reason for NFPA 70 to uniquely include specific provisions to regulate ammonia refrigeration in Section 505.5, given that there is no other material or application similarly regulated by this section. Any other material or application is governed by the general requirement. With the proposed change, classification of an area containing ammonia refrigeration equipment will be done in the same manner as any other material or application. The risk and mitigation measures must be evaluated using the NEC, NFPA 497 and other applicable codes/standards; and the area classification must established based on that evaluation, as stated in the first paragraph of 505.5. In the case of ammonia refrigeration, ANSI/ASHRAE 15 and ANSI/IIAR 2 provide detailed requirements covering the use of leak detection and ventilation systems that are too complex to duplicate into the NEC.

By approving this change, the NEC will eliminate overlap and conflict with these other ANSI standards, and by retaining the Informational Note pointing to these standards, users will be made aware of the special requirements and not be left with the impression that requirements for ammonia were simply dropped.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3915-NFPA 70-2015
Statement: This change will correlate the NEC® with applicable ANSI standards that govern ammonia refrigeration systems, ANSI/IIAR 2 and ANSI/ASHRAE 15. Ammonia refrigeration machinery rooms are always required by these standards to have leak detection and ventilation systems and are designated as unclassified locations based on these mitigations. The
NEC® is therefore being updated to reflect IIAR 2’s more restrictive 150 ppm ventilation trigger. Other areas where ammonia refrigeration equipment may be present, such as freezers, may have detection, alarms, ventilation or other mitigation measures approved by the AHJ, in accordance with ANSI/ASHRAE 15 and ANSI/IIAR 2 as a basis of assigning an unclassified area designation. The provisions in these standards are too lengthy to warrant duplication in the NEC® for such a special situation. Informational Note 2 provides an appropriate pointer directing NEC® users to ANSI/ASHRAE 15 and ANSI/IIAR 2 for guidance, and these are legally mandated reference standards in adopted fire and mechanical codes.
**Class I, Zone 0.**

A Class I, Zone 0 location is a location in which

1. Ignitible concentrations of flammable gases or vapors are present continuously, or
2. Ignitible concentrations of flammable gases or vapors are present for long periods of time.

**Informational Note No. 1:** As a guide in determining when flammable gases or vapors are present continuously or for long periods of time, refer to ANSI/API RP 505-1997, Recommended Practice for Classification of Locations for Electrical Installations of Petroleum Facilities Classified as Class I, Zone 0, Zone 1 or Zone 2; ANSI/ISA-TR12.24.01-1998 (IEC 60079-10 Mod), Recommended Practice for Classification of Locations for Electrical Installations Classified as Class I, Zone 0, Zone 1, or Zone 2; IEC 60079-10-1995, Electrical apparatus for explosive gas atmospheres, classifications of hazardous areas; and Area Classification Code for Petroleum Installations, Model Code, Part 15, Institute of Petroleum.

**Informational Note No. 2:** This classification includes locations inside vented tanks or vessels that contain volatile flammable liquids; inside inadequately vented spraying or coating enclosures, where volatile flammable solvents are used; between the inner and outer roof sections of a floating roof tank containing volatile flammable liquids; inside open vessels, tanks and pits containing volatile flammable liquids; the interior of an exhaust duct that is used to vent ignitible concentrations of gases or vapors; and inside inadequately ventilated enclosures that contain normally venting instruments utilizing or analyzing flammable fluids and venting to the inside of the enclosures.

**Statement of Problem and Substantiation for Public Comment**

RP 505 reference date update. The next edition of ANSI/API RP 505 has been completed, balloted, and is anticipated to be published before the end of 2015.

**Committee Statement**

**Committee Action:** Rejected  
**Resolution:** The next revision of document, ANSI/API RP 505 has not yet been published and thus the document is not available for review or update of the publication date.
For purposes of testing, approval, and area classification, various air mixtures (not oxygen enriched) shall be grouped as required in 505.6(A), (B), and (C).

Informational Note No. 1: Group I is intended for use in describing atmospheres that contain firedamp (a mixture of gases, composed mostly of methane, found underground, usually in mines). This Code does not apply to installations underground in mines. See 90.2(B).

Informational Note No. 2: The gas and vapor subdivision as described above is based on the maximum experimental safe gap (MESG), minimum igniting current (MIC), or both. Test equipment for determining the MESG is described in IEC 60079-1A-1975, Amendment No. 1 (1993), Construction and verification tests of flameproof enclosures of electrical apparatus and, UL Technical Report No. 58 (1993). The test equipment for determining MIC is described in IEC 60079-11-1999, Electrical apparatus for explosive gas atmospheres. Equipment Safety by Intrinsic safety. The classification of gases or vapors according to their maximum experimental safe gaps and minimum igniting currents is described in IEC 60079-12-1978, Explosive Atmospheres—Part 11: Classification of mixtures of gases or vapours with air according to their maximum experimental safe gaps and minimum igniting currents 2012, Explosive Atmospheres—Part 20-1: Characteristics for Gas and Vapour Classification—Tests, Methods, and Data.

Informational Note No. 3: Group II is currently subdivided into Group IIA, Group IIB, and Group IIC. Prior marking requirements permitted some types of protection to be marked without a subdivision, showing only Group II.

Informational Note No. 4: It is necessary that the meanings of the different equipment markings and Group II classifications be carefully observed to avoid confusion with Class I, Divisions 1 and 2, Groups A, B, C, and D.

Class I, Zone 0, 1, and 2, groups shall be as follows:

Statement of Problem and Substantiation for Public Comment

In informational note 2 removed an withdrawn IEC standard and UL technical report.
In informational note 2 referenced updated edition of IEC 60079-11.
In informational note 2 referenced IEC 60079-20-1 which supersedes IEC 60079-12.

Committee Statement
Committee Action: Rejected but held
Resolution: No public inputs were made and no first revisions were introduced to Section 505.6 so the proposed comments at this second revision stage have not been subject to public review. As such, the proposed changes are new material at this stage of the revision process and are recommended to be held for the next revision.
505.8 Protection Techniques.

Acceptable protection techniques for electrical and electronic equipment in hazardous (classified) locations shall be as described in 505.8(A) through (I).

Informational Note: For additional information, see ANSI/ISA-60079-0, (12.00.01)-2009, Explosive Atmospheres — Part 0: Equipment — General Requirements; ANSI/ISA 12.01.01-2013, Definitions and Information Pertaining to Electrical Apparatus. Electrical Equipment, in Hazardous (Classified) Locations; and ANSI/UL 60079–0, Electrical Apparatus for Explosive Gas Atmospheres — Part 0: General Requirements.

(A) Flameproof “d”.
This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

(B) Pressurization “p”.
This protection technique shall be permitted for equipment in those Class I, Zone 1 or Zone 2 locations for which it is identified.

(C) Intrinsic Safety “i”.
This protection technique shall be permitted for apparatus and associated apparatus in Class I, Zone 0, Zone 1, or Zone 2 locations for which it is listed.

(D) Type of Protection “n”.
This protection technique shall be permitted for equipment in Class I, Zone 2 locations. Type of protection “n” is further subdivided into nA, nC, and nR.

Informational Note: See Table 505.9(C)(2)(4) for the descriptions of subdivisions for type of protection “n”.

(E) Oil Immersion “o”.
This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

(F) Increased Safety “e”.
This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

(G) Encapsulation “m”.
This protection technique shall be permitted for equipment in Class I, Zone 0, Zone 1, or Zone 2 locations for which it is identified.

Informational Note: See Table 505.9(C)(2)(4) for the descriptions of subdivisions for encapsulation.

(H) Powder Filling “q”.
This protection technique shall be permitted for equipment in Class I, Zone 1 or Zone 2 locations.

(I) Combustible Gas Detection System.
A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public access and where the conditions of maintenance and supervision ensure that only qualified persons service the installation. Where such a system is installed, equipment specified in 505.8(I)(1), (I)(2), or (I)(3) shall be permitted. The type of detection equipment, its listing, installation location(s), alarm and shutdown criteria, and calibration frequency shall be documented when combustible gas detectors are used as a protection technique.

Informational Note No. 1: For further information, see ANSI/API RP 505-1997, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, and Zone 2.

Informational Note No. 2: For further information, see ANSI/ISA-60079-29-2013, Explosive Atmospheres — Part 29-2: Gas detectors — Selection, installation, use and maintenance of detectors for flammable gases and oxygen.

Informational Note No. 3: For further information, see ANSI/ISA-TR12.13.03-2009, Guide for Combustible Gas Detection as a Method of Protection.

(1) Inadequate Ventilation.
In a Class I, Zone 1 location that is so classified due to inadequate ventilation, electrical equipment suitable for Class I, Zone 2 locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Zone 1, for the appropriate material group, and for the detection of the specific gas or vapor to be encountered.

(2) Interior of a Building.
In a building located in, or with an opening into, a Class I, Zone 2 location where the interior does not contain a source of flammable gas or vapor, electrical equipment for unclassified locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Zone 1 or Class I, Zone 2, for the appropriate material group, and for the detection of the specific gas or vapor to be encountered.
Interior of a Control Panel.

In the interior of a control panel containing instrumentation utilizing or measuring flammable liquids, gases, or vapors, electrical equipment suitable for Class I, Zone 2 locations shall be permitted. Combustible gas detection equipment shall be listed for Class I, Zone 1, for the appropriate material group, and for the detection of the specific gas or vapor to be encountered.

Committee Statement

Committee Action: Rejected but held
Resolution: No public inputs were made and no first revisions were introduced to Section 505.8 related to changing the references in the informational notes so the proposed comments at this second revision stage have not been subject to public review. As such, the proposed changes are new material at this stage of the revision process and are recommended to be held for the next revision.
A combustible gas detection system shall be permitted as a means of protection in industrial establishments with restricted public access and where the conditions of maintenance and supervision ensure that only qualified persons service the installation. Where such a system is installed, equipment specified in 505.8(I)(1), (I)(2), or (I)(3) shall be permitted. The type of detection equipment, its listing, installation location(s), alarm and shutdown criteria, and calibration frequency shall be documented when combustible gas detectors are used as a protection technique.

Informational Note No. 1: For further information, see ANSI/API RP 505-1997 2015, Recommended Practice for Classification of Locations for Electrical Installations at Petroleum Facilities Classified as Class I, Zone 0, Zone 1, and Zone 2.

Informational Note No. 2: For further information, see ANSI/ISA-60079-29-2, Explosive Atmospheres — Part 29-2: Gas detectors — Selection, installation, use and maintenance of detectors for flammable gases and oxygen.

Informational Note No. 3: For further information, see ANSI/ISA-TR12.13.03-2009, Guide for Combustible Gas Detection as a Method of Protection.

Committee Statement:

Committee Action: Rejected
Resolution: The next revision of document, ANSI/API RP 505 has not yet been published and thus the document is not available for review or update of the publication date.
505.9 Equipment.

(A) Suitability.

Suitability of identified equipment shall be determined by one of the following:

(1) Equipment listing or labeling

(2) Evidence of equipment evaluation from a qualified testing laboratory or inspection agency concerned with product evaluation

(3) Evidence acceptable to the authority having jurisdiction such as a manufacturer's self-evaluation or an owner's engineering judgment

Informational Note: Additional documentation for equipment may include certificates demonstrating compliance with applicable equipment standards, indicating special conditions of use, and other pertinent information.

(B) Listing.

(1) Equipment that is listed for a Zone 0 location shall be permitted in a Zone 1 or Zone 2 location of the same gas or vapor, provided that it is installed in accordance with the requirements for the marked type of protection. Equipment that is listed for a Zone 1 location shall be permitted in a Zone 2 location of the same gas or vapor, provided that it is installed in accordance with the requirements for the marked type of protection.

(2) Equipment shall be permitted to be listed for a specific gas or vapor, specific mixtures of gases or vapors, or any specific combination of gases or vapors.

Informational Note: One common example is equipment marked for "IIB + H2."

(C) Marking.

Equipment shall be marked in accordance with 505.9(C)(1) or (C)(2).

(1) Division Equipment.

Equipment identified for Class I, Division 1 or Class I, Division 2 shall, in addition to being marked in accordance with 500.8(C), be permitted to be marked with all of the following:

(1) Class I, Zone 1 or Class I, Zone 2 (as applicable)

(2) Applicable gas classification group(s) in accordance with Table 505.9(C)(1)(2)

(3) Temperature classification in accordance with 505.9(D)(1)

Table 505.9(C)(1)(2) Material Groups

<table>
<thead>

<tr>
<td>IIB</td>
<td>See 505.6(B)</td>
</tr>
<tr>
<td>IIA</td>
<td>See 505.6(C)</td>
</tr>
</tbody>
</table>
(2) Zone Equipment.
Equipment meeting one or more of the protection techniques described in 505.8 shall be marked with all of the following in the order shown:

1. Class
2. Zone
3. Symbol “AEx”
4. Protection technique(s) in accordance with Table 505.9(C)(2)(4)
5. Applicable material group in accordance with Table 505.9(C)(1)(2) or a specific gas or vapor
6. Temperature classification in accordance with 505.9(D)(1)

Exception No. 1: Associated apparatus NOT suitable for installation in a hazardous (classified) location shall be required to be marked only with (3), (4), and (5), but BOTH the symbol AEx (3) and the symbol for the type of protection (4) shall be enclosed within the same square brackets, for example, [AEx ia] IIC.

Exception No. 2: Simple apparatus as defined in 504.2 shall not be required to have a marked operating temperature or temperature class.

Exception No. 3: Fittings for the termination of cables shall not be required to have a marked operating temperature or temperature class.

Informational Note No. 1: An example of the required marking for intrinsically safe apparatus for installation in Class I, Zone 0 is “Class I, Zone 0, AEx ia IIC T6.” An explanation of the marking that is required is shown in Informational Note Figure 505.9(C)(2), No.1.

Informational Note No. 2: An example of the required marking for intrinsically safe associated apparatus mounted in a flameproof enclosure for installation in Class I, Zone 1 is “Class I, Zone 1 AEx d[ia] IIC T4.”

Informational Note No. 3: An example of the required marking for intrinsically safe associated apparatus NOT for installation in a hazardous (classified) location is “[AEx ia] IIC.”

Informational Note No. 4: The EPL (or equipment protection level) may appear in the product marking. EPLs are designated as G for gas, D for dust, or M for mining and are then followed by a letter (a, b, or c) to give the user a better understanding as to whether the equipment provides either (a) a “very high,” (b) a “high,” or (c) an “enhanced” level of protection against ignition of an explosive atmosphere. For example, a Class I, Zone 1, AEx d IIC T4 motor (which is suitable by protection concept for application in Zone 1) may additionally be marked with an EPL of “Gb” to indicate that it was provided with a high level of protection, such as Class I, Zone 1 AEx d IIC T4 Gb.

Informational Note No. 5: Equipment installed outside a Zone 0 location, electrically connected to equipment located inside a Zone 0 location, may be marked Class I, Zone 0(1). The “/” indicates that equipment contains a separation element and can be installed at the boundary between a Zone 0 and a Zone 1 location. See ANSI/ISA-60079-26, Electrical Apparatus -2011, Explosive Atmospheres - Part 26: Equipment for Use in Class I, Zone 0 Hazardous (Classified) Locations.

Informational Note Figure 505.9(C)(2), No.1, Zone Equipment Marking.

*Does not address use where a combination of techniques is used.

**Associated apparatus is permitted to be installed in a hazardous (classified) location if suitably protected using another type of protection.

(D) Class I Temperature.

The temperature marking specified in 505.9(D)(1) shall not exceed the autoignition temperature of the specific gas or vapor to be encountered.

Informational Note: For information regarding autoignition temperatures of gases and vapors, see NFPA 497-2012, Recommended Practice for the Classification of Flammable Liquids, Gases, or Vapors and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas; and IEC 60079-20-1996, Electrical Apparatus for Explosive Gas Atmospheres, Data for Flammable Gases and Vapours, Relating to the Use of Electrical Apparatus 1-2012, Explosive Atmospheres - Part 20-1: Material Characteristics for Gas and Vapour Classification - Test Methods and Data (Supersedes IEC 60079-20).
(1) Temperature Classifications.

Equipment shall be marked to show the operating temperature or temperature class referenced to a 40°C ambient, or at the higher ambient temperature if the equipment is rated and marked for an ambient temperature of greater than 40°C. The temperature class, if provided, shall be indicated using the temperature class (T code) shown in Table 505.9(D)(1).

Table 505.9(D)(1) Classification of Maximum Surface Temperature for Group II Electrical Equipment

</tr>
</tbody>
</table>

Electrical equipment designed for use in the ambient temperature range between -20°C and ± 40°C shall require no ambient temperature marking.

Electrical equipment that is designed for use in a range of ambient temperatures other than -20°C to ± 40°C is considered to be special; and the ambient temperature range shall then be marked on the equipment, including either the symbol “Ta” or “Tamb” together with the special range of ambient temperatures, in degrees Celsius.

Informational Note: As an example, such a marking might be “-30°C to ± 40°C.”

Exception No. 1: Equipment of the non–heat-producing type, such as conduit fittings, and equipment of the heat-producing type having a maximum temperature of not more than 100°C (212°F) shall not be required to have a marked operating temperature or temperature class.

Exception No. 2: Equipment identified for Class I, Division 1 or Division 2 locations as permitted by 505.20(A), (B), and (C) shall be permitted to be marked in accordance with 505.8(C) and Table 500.8(C).

(E) Threading.

The supply connection entry thread form shall be NPT or metric. Conduit and fittings shall be made wrenchtight to prevent sparking when fault current flows through the conduit system, and to ensure the explosionproof or flameproof integrity of the conduit system where applicable. Equipment provided with threaded entries for field wiring connections shall be installed in accordance with 505.9(E)(1) or (E)(2) and with (E)(3).

(1) Equipment Provided with Threaded Entries for NPT Threaded Conduit or Fittings.

For equipment provided with threaded entries for NPT threaded conduit or fittings, listed conduit, listed conduit fittings, or listed cable fittings shall be used.

All NPT threaded conduit and fittings shall be threaded with a National (American) Standard Pipe Taper (NPT) thread.

NPT threaded entries into explosionproof or flameproof equipment shall be made up with at least five threads fully engaged.

Exception: For listed explosionproof or flameproof equipment, factory-threaded NPT entries shall be made up with at least 4 1/2 threads fully engaged.

Informational Note No. 1: Thread specifications for male NPT threads are located in ANSI/ASME B1.20.1-2013, Pipe Threads, General Purpose (Inch).

(2) Equipment Provided with Threaded Entries for Metric Threaded Conduit or Fittings.

For equipment provided with metric threaded entries, listed conduit fittings or listed cable fittings shall be used. Such entries shall be identified as being metric, or listed adapters to permit connection to conduit or NPT threaded fittings shall be provided with the equipment and shall be used for connection to conduit or NPT threaded fittings.

Metric threaded fittings installed into explosionproof or flameproof equipment entries shall have a class of fit of at least 6g/6H and be made up with at least five threads fully engaged for Groups C, D, IIB, or IIA and not less than eight threads fully engaged and wrenchtight.

(3) Unused Openings.

All unused openings shall be closed with close-up plugs listed for the location and shall maintain the type of protection. The plug engagement shall comply with 505.9(E)(1) or 505.9(E)(2).
Optical Fiber Cables.
An optical fiber cable, with or without current-carrying current (composite optical fiber cable), shall be installed to address the associated fire hazard and sealed to address the associated explosion hazard in accordance with the requirements of 505.15 and 505.16.

Committee Statement

Committee Action: Rejected but held
Resolution: No public inputs were made and no first revisions were introduced to Section 505.9 related to changing the references in the informational notes so the proposed comments at this second revision stage have not been subject to public review. As such, the proposed changes are new material at this stage of the revision process and are recommended to be held for the next revision.
505.15 Wiring Methods.

Wiring methods shall maintain the integrity of protection techniques and shall comply with 505.15(A) through (C).

(A) Class I, Zone 0.

In Class I, Zone 0 locations, equipment protected by intrinsic safety “ia” and equipment protected by encapsulation “ma” shall be connected using intrinsically safe “ia” circuits with wiring methods in accordance with Article 504.

(B) Class I, Zone 1.
(1) General.

In Class I, Zone 1 locations, the wiring methods in 505.15(B)(1) (a) through (B)(1)(i) shall be permitted.

(a) All wiring methods permitted by 505.15(A).

(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application. Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application. Type ITC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

Informational Note: See 727.4 and 727.5 for restrictions on use of Type ITC cable.

(d) Type MI cable terminated with fittings listed for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(e) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(f) Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emerge or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.

(g) Intrinsic safety type of protection “ib” shall be permitted using the wiring methods specified in Article 504.

Informational Note: For entry into enclosures required to be flameproof, explosionproof, or of increased safety, see the information on construction, testing, and marking of cables; flameproof and increased safety cable fittings; and flameproof and increased safety cord connectors in ANSI/UL 2225-2013, Cables and Cable-Fittings for Use in Hazardous (Classified) Locations.

(2) Flexible Connections.

Where necessary to employ flexible connections, flexible fittings listed for Class I, Zone 1 or Division 1 locations, or flexible cord in accordance with the provisions of 505.17(A) terminated with a listed cord connector that maintains the type of protection of the terminal compartment, shall be permitted.

(C) Class I, Zone 2.
In Class I, Zone 2 locations, the following wiring methods shall be permitted:

1. All wiring methods permitted by 505.15(B).
2. Types MC, MV, TC, or TC-ER cable, including installation in cable tray systems. The cable shall be terminated with listed fittings. Single conductor Type MV cables shall be shielded or metallic-armored.
3. Type ITC and Type ITC-ER cable as permitted in 727.4 and terminated with listed fittings.
4. Type PLTC and Type PLTC-ER cable in accordance with the provisions of Article 725, including installation in cable tray systems. The cable shall be terminated with listed fittings.
5. Enclosed gasketed busways, enclosed gasketed wireways.
6. In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where metallic conduit does not provide sufficient corrosion resistance, listed reinforced thermosetting resin conduit (RTRC), factory elbows, and associated fittings, all marked with the suffix -XW, and Schedule 80 PVC conduit, factory elbows, and associated fittings shall be permitted. Where seals are required for boundary conditions as defined in 505.16(C)(1)(b), the Zone 1 wiring method shall extend into the Zone 2 area to the seal, which shall be located on the Zone 2 side of the Zone 1/Zone 2 boundary.
7. Intrinsic safety type of protection “ic” shall be permitted using any of the wiring methods permitted for unclassified locations. Intrinsic safety type of protection “ic” systems shall be installed in accordance with the control drawing(s). Simple apparatus, not shown on the control drawing, shall be permitted in an intrinsic safety type of protection “ic” circuit, provided that the simple apparatus does not interconnect the intrinsic safety type of protection “ic” systems to any other circuit.

Informational Note: Simple apparatus is defined in 504.2.
8. Optical fiber cable of Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in cable trays or any other raceway in accordance with 505.15(C). Optical fiber cable shall be sealed in accordance with 505.16.
9. Cablebus. Separate intrinsic safety type of protection “ic” systems shall be installed in accordance with one of the following:
   1. In separate cables
   2. In multiconductor cables where the conductors of each circuit are within a grounded metal shield
   3. In multiconductor cables where the conductors of each circuit have insulation with a minimum thickness of 0.25 mm (0.01 in.)

2. Flexible Connections.
Where provision must be made for flexibility, flexible metal fittings, flexible metal conduit with listed fittings, liquidtight flexible metal conduit with listed fittings, liquidtight flexible nonmetallic conduit with listed fittings, or flexible cord in accordance with the provisions of 505.17 terminated with a listed cord connector that maintains the type of protection of the terminal compartment shall be permitted.

Informational Note: See 505.25(B) for grounding requirements where flexible conduit is used.

Exception: For elevator use, an identified elevator cable of Type EO, ETP, or ETT, shown under the “use” column in Table 400.4 for “hazardous (classified) locations,” that is terminated with listed connectors that maintain the type of protection of the terminal compartment, shall be permitted.

Public Comment No. 1065-NFPA 70-2015 [Section No. 505.15(B)(1)]

(1) General.
In Class I, Zone 1 locations, the wiring methods in 505.15(B)(1) (a) through (B)(1)(i) shall be permitted.

(a) All wiring methods permitted by 505.15(A).

(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application. Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application. Type ITC-HL cable shall be installed in accordance with the provisions of Article 727.

Informational Note: See 727.4 and 727.5 for restrictions on use of Type ITC cable.

(d) Type MI cable terminated with fittings listed for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(e) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(f) Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide electrical continuity of the raceway system and for grounding of non-current-carrying metal parts.

(g) Intrinsic safety type of protection "ib" shall be permitted using the wiring methods specified in Article 504.

Informational Note: For entry into enclosures required to be flameproof, explosionproof, or of increased safety, see the information on construction, testing, and marking of cables; flameproof and increased safety cable fittings; and flameproof and increased safety cord connectors in ANSI/UL 2225-2011, Cables and Cable-Fittings for Use in Hazardous (Classified) Locations.

(h) Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in raceways in accordance with 505.15(B). Optical fiber cable shall be sealed in accordance with 505.16.

Informational Note: For entry into enclosures required to be flameproof, explosionproof, or of increased safety, see the information on construction, testing, and marking of cables; flameproof and increased safety cable fittings; and flameproof and increased safety cord connectors in ANSI/UL 2225-2011, Cables and Cable-Fittings for Use in Hazardous (Classified) Locations.

(i) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts nominal or less, and where the cable is not subject to physical damage, Type TC-ER-HL cable listed for use in Class I, Zone 1 locations, with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the location, Type TC-ER-HL cable shall be installed in accordance with the provisions of Article 336, including the restrictions of 336.10(7). For circuits over 150 volts to ground nominal or 30 amps, the TC-ER-HL cables shall have a metallic shield covering the current carrying conductor to provide a reliable ground fault path that will ensure the operation of a ground fault protection device.

Statement of Problem and Substantiation for Public Comment

TC-ER-HL Cable was added as a new product in 2014 NEC. There has been little experience with the use of TC-ER-HL Cables in Class I, Division 1 and Zone 1 locations even for under 1 inch diameter. If the cable size is going to become unrestricted then we should include metal shield to provide ground fault protection for the over 150 volts and over 30 amp circuits.

Related Item
Committee Statement

Committee Action: Rejected

Resolution: There is no substantiation presented as to why the wiring method is "unsafe". If the TC-ER-HL has been installed in accordance with Article 336, it will be predominantly in a cable tray. Any extended run out of the tray is required to be protected by the location. If the cable is being damaged by the location, Section 110.11 may not have been correctly applied. There is no requirement that this wiring method be used in all installations. It provides another option. The restriction to industrial facilities, limitation on public access, and conditions of maintenance ensure that this will not be used in areas like filling stations that have public access. The shielded construction described is already permitted by UL 1277 and UL 2225, and in fact is often used for the twisted pair constructions. Shielding is for EMC and not for equipment grounding.
(1) General.

In Class I, Zone 1 locations, the wiring methods in 505.15(B)(1) (a) through (B)(1)(i) shall be permitted.

(a) All wiring methods permitted by 505.15(A).

(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vapor tight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application. Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vapor tight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application. Type ITC-HL cable shall be installed in accordance with the provisions of Article 727.

Informational Note: See 727.4 and 727.5 for restrictions on use of Type ITC cable.

(d) Type MI cable terminated with fittings listed for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(e) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(f) Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non-current-carrying metal parts.

(g) Intrinsic safety type of protection “ib” shall be permitted using the wiring methods specified in Article 504.

Informational Note: For entry into enclosures required to be flameproof, explosionproof, or of increased safety, see the information on construction, testing, and marking of cables; flameproof and increased safety cable fittings; and flameproof and increased safety cord connectors in ANSI/UL 2225-2011, Cables and Cable-Fittings for Use in Hazardous (Classified) Locations.

(h) Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in raceways in accordance with 505.15(B). Optical fiber cable shall be sealed in accordance with 505.16.

Informational Note: For entry into enclosures required to be flameproof, explosionproof, or of increased safety, see the information on construction, testing, and marking of cables; flameproof and increased safety cable fittings; and flameproof and increased safety cord connectors in ANSI/UL 2225-2011, Cables and Cable-Fittings for Use in Hazardous (Classified) Locations.

(i) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts nominal or less, and where the cable is not subject to physical damage, Type TC-ER-HL cable listed for use in Class I, Zone 1 locations, with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the location. Type TC-ER-HL cable shall be installed in accordance with the provisions of Article 336, including the restrictions of 336.10(2).

Statement of Problem and Substantiation for Public Comment

Expanding the use of TC-ER-HL as a fixed wiring method in Class I Zone 1 locations is a severe reduction in wiring method protection. Certain flammable gases or combustible vapors that are likely to be present in these locations are likely to affect the physical properties of the jacket material and penetrate into the cable. A nonmetallic jacket such as those used on Type TC cables (including those designated as -ER and/or -HL) alone will not provide protection equal to metallic wiring methods against the hazards present in Class I...
Zone 1 locations. All other Class I Zone 1 fixed wiring methods (except optical fiber products) presently require metallic raceways, MI cable or a gas/vaportight metallic armor wiring method. These are proven wiring methods that maintain the appropriate level of protection and safety. Nonmetallic wiring methods in these locations are required to be encased in concrete, and similar protection should be required for TC-ER-HL if it is permitted. The 2014 NEC allowed the use of 1” TC-ER-HL, but it should be limited to flexible connections, not unlimited lengths of fixed wiring.

The shielded construction described is already permitted by UL 1277 and UL 2225, and in fact is often used for the twisted pair constructions. Shielding is for EMC and not for equipment grounding.
Public Comment No. 1380-NFPA 70-2015 [Section No. 505.15(B)(1)]

(1) General.

In Class I, Zone 1 locations, the wiring methods in 505.15(B)(1) (a) through (B)(1)(i) shall be permitted.

(a) All wiring methods permitted by 505.15(A).

(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application. Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application. Type ITC-HL cable shall be installed in accordance with the provisions of Article 727.

Informational Note: See 727.4 and 727.5 for restrictions on use of Type ITC cable.

(d) Type MI cable terminated with fittings listed for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(e) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(f) Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non-current-carrying metal parts.

(g) Intrinsic safety type of protection "ib" shall be permitted using the wiring methods specified in Article 504.

Informational Note: For entry into enclosures required to be flameproof, explosionproof, or of increased safety, see the information on construction, testing, and marking of cables; flameproof and increased safety cable fittings; and flameproof and increased safety cord connectors in ANSI/UL 2225-2011, Cables and Cable-Fittings for Use in Hazardous (Classified) Locations.

(h) Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in raceways in accordance with 505.15(B). Optical fiber cable shall be sealed in accordance with 505.16.

Informational Note: For entry into enclosures required to be flameproof, explosionproof, or of increased safety, see the information on construction, testing, and marking of cables; flameproof and increased safety cable fittings; and flameproof and increased safety cord connectors in ANSI/UL 2225-2011, Cables and Cable-Fittings for Use in Hazardous (Classified) Locations.

(i) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts nominal or less, and where the cable is not subject to physical damage, Type TC-ER-HL cable listed for use in Class I, Zone 1 locations, with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the location, Type TC-ER-HL cable shall be installed in accordance with the provisions of Article 336.10, including the restrictions of 336.10(7).

Statement of Problem and Substantiation for Public Comment

As currently written, there are no restrictions in the use of non-armored cable in Zone 1 locations which could compromise the level of safety at the location. The use of this cable in Zone 1 locations is suitable provided there are appropriate restrictions requiring a grounding shield above the voltage or current levels identified in the proposed text to ensure the operation of the circuit's ground fault protection device.

Public Comment No. 846-NFPA 70-2015 [ Section No. 505.15(B)(1) ]

(1) General.
In Class I, Zone 1 locations, the wiring methods in 505.15(B)(1) (a) through (B)(1)(i) shall be permitted.

(a) All wiring methods permitted by 505.15(A).

(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vapor tight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application. Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vapor tight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application. Type ITC-HL cable shall be installed in accordance with the provisions of Article 727.

Informational Note: See 727.4 and 727.5 for restrictions on use of Type ITC cable.

(d) Type MI cable terminated with fittings listed for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(e) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(f) Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.

(g) Intrinsic safety type of protection “ib” shall be permitted using the wiring methods specified in Article 504.

Informational Note: For entry into enclosures required to be flameproof, explosionproof, or of increased safety, see the information on construction, testing, and marking of cables; flameproof and increased safety cable fittings; and flameproof and increased safety cord connectors in ANSI/UL 2225-2011, Cables and Cable-Fittings for Use in Hazardous (Classified) Locations.

(h) Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in raceways in accordance with 505.15(B). Optical fiber cable shall be sealed in accordance with 505.16.

Informational Note: For entry into enclosures required to be flameproof, explosionproof, or of increased safety, see the information on construction, testing, and marking of cables; flameproof and increased safety cable fittings; and flameproof and increased safety cord connectors in ANSI/UL 2225-2011, Cables and Cable-Fittings for Use in Hazardous (Classified) Locations.

(i) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts nominal or less, for cable diameters 25mm (1 in) or less, and where the cable is not subject to physical damage, Type TC-ER-HL cable listed for use in Class I, Zone 1 locations, with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the location, Type TC-ER-HL cable shall be installed in accordance with the provisions of Article 336, including the restrictions of 336.10(7).

Statement of Problem and Substantiation for Public Comment

No changes to the informational notes.

Type TC-ER-HL is limited to 1” by the product standard and should continue to be limited in size and use to maintain the safety of wiring methods allowed in Class I, Zone 1 locations.

Public Comment No. 904-NFPA 70-2015 [Section No. 505.15(B)(1)]

(1) General.
In Class I, Zone 1 locations, the wiring methods in 505.15(B)(1) (a) through (B)(1)(i) shall be permitted.

(a) All wiring methods permitted by 505.15(A).

(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vapor tight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application. Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type ITC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vapor tight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material, and terminated with fittings listed for the application. Type ITC-HL cable shall be installed in accordance with the provisions of Article 727.

Informational Note: See 727.4 and 727.5 for restrictions on use of Type ITC cable.

(d) Type MI cable terminated with fittings listed for Class I, Zone 1 or Division 1 locations. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

(e) Threaded rigid metal conduit, or threaded steel intermediate metal conduit.

(f) Type PVC conduit and Type RTRC conduit shall be permitted where encased in a concrete envelope a minimum of 50 mm (2 in.) thick and provided with not less than 600 mm (24 in.) of cover measured from the top of the conduit to grade. Threaded rigid metal conduit or threaded steel intermediate metal conduit shall be used for the last 600 mm (24 in.) of the underground run to emergence or to the point of connection to the aboveground raceway. An equipment grounding conductor shall be included to provide for electrical continuity of the raceway system and for grounding of non–current-carrying metal parts.

Informational Note: For entry into enclosures required to be flameproof, explosionproof, or of increased safety, see the information on construction, testing, and marking of cables; flameproof and increased safety cable fittings; and flameproof and increased safety cord connectors in ANSI/UL 2225-2011, Cables and Cable-Fittings for Use in Hazardous (Classified) Locations.

(g) Intrinsic safety type of protection "ib" shall be permitted using the wiring methods specified in Article 504.

Informational Note: For entry into enclosures required to be flameproof, explosionproof, or of increased safety, see the information on construction, testing, and marking of cables; flameproof and increased safety cable fittings; and flameproof and increased safety cord connectors in ANSI/UL 2225-2011, Cables and Cable-Fittings for Use in Hazardous (Classified) Locations.

(h) Optical fiber cable Types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in raceways in accordance with 505.15(B). Optical fiber cable shall be sealed in accordance with 505.16.

Informational Note: For entry into enclosures required to be flameproof, explosionproof, or of increased safety, see the information on construction, testing, and marking of cables; flameproof and increased safety cable fittings; and flameproof and increased safety cord connectors in ANSI/UL 2225-2011, Cables and Cable-Fittings for Use in Hazardous (Classified) Locations.

(i) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts nominal or less, for cable diameters 25 mm (1 in.) or less, and where the cable is not subject to physical damage, Type TC-ER-HL cable listed for use in Class I, Zone 1 locations, with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the location, Type TC-ER-HL cable shall be installed in accordance with the provisions of Article 336, including the restrictions of 336.10(7).

Statement of Problem and Substantiation for Public Comment

All metallic conduit systems are protected against rust and corrosion. The submitter mentions in their substantiation that deficiencies exist with cables with diameters above and below 25mm. The fact that there are deficiencies in cables with diameters less than 25mm should not be acceptable substantiation to allow cables with diameters greater than 25mm.

505.17 Flexible Cables, Cords and Connections.
A flexible cord shall be permitted for connection between portable lighting equipment or other portable utilization equipment and
the fixed portion of their supply circuit. Flexible cord shall also be permitted for that portion of the circuit where the fixed wiring
methods of 505.15(B) and (C) cannot provide the necessary degree of movement for fixed and mobile electrical utilization
equipment in an industrial establishment where conditions of maintenance and engineering supervision ensure that only
qualified persons install and service the installation, and where the flexible cord is protected by location or by a suitable guard
from damage. The length of the flexible cord shall be continuous. Where flexible cords are used, the cords shall comply with the
following:

1. Be of a type listed for extra-hard usage.
2. Contain, in addition to the conductors of the circuit, an equipment grounding conductor complying with 400.23.
3. Be connected to terminals or to supply conductors in an approved manner.
4. Be supported by clamps or by other suitable means in such a manner that there will be no tension on the terminal
   connections.
5. Be terminated with a listed cord connector that maintains the type of protection where the flexible cord enters boxes,
   fittings, or enclosures that are required to be explosionproof or flameproof.
6. Cord entering an increased safety “e” enclosure shall be terminated with a listed increased safety “e” cord connector.

Informational Note: See 400.10 for permitted uses of flexible cords.

Electric submersible pumps with means for removal without entering the wet-pit shall be considered portable utilization
equipment. The extension of the flexible cord within a suitable raceway between the wet-pit and the power source shall be
permitted.

Electric mixers intended for travel into and out of open-type mixing tanks or vats shall be considered portable utilization
equipment.

Informational Note: See 505.18 for flexible cords exposed to liquids having a deleterious effect on the conductor
insulation.

(B) Power, Control, and Instrumentation Connections for Zone 1 and 2.

To facilitate replacements in industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage; power, control, and instrumentation replacements, process control instruments shall be permitted to be connected through Type TC-ER-HL cable, by means of attachment plugs, flexible cords, attachment plugs, and receptacles, provided that all of the following conditions apply:

- Attachment plug and receptacle are listed for use in Class I, Zone 1 locations and for use with TC-ER-HL cable.
  
  Exception: A Class I, Zone 1 listing is not required if the circuit type of protection is “ia” or “ib”.

- Type TC-ER-HL cable is listed for use in Class I, Zone 1 locations.
- Type TC-ER-HL cable is installed in accordance with the provisions of Article 336, including the restrictions of 336.10(7).
- Only necessary receptacles are provided.
- Unless the attachment plug and receptacle are interlocked mechanically or electrically, or otherwise designed so that they
  cannot be separated when the contacts are energized and the contacts cannot be energized when the plug and socket outlet
  are separated, a switch listed for the location is provided so that the attachment plug or receptacle is not depended on to interrupt current. Exception: A switch is not required if, unless the circuit type of protection is “ia” or “ib”.
- Type TC-ER-HL cable is listed for use in Class I, Zone 1 locations.
- Type TC-ER-HL cable is installed in accordance with the provisions of Article 336, including the restrictions of 336.10(7).
- Only necessary receptacles are provided.
- Unless the attachment plug and receptacle are interlocked mechanically or electrically, or otherwise designed so that they
  cannot be separated when the contacts are energized and the contacts cannot be energized when the plug and socket outlet
  are separated, the instrumentation receptacle carries a label warning against plugging or unplugging under load.

(C) - Power, Control, and Instrumentation Connections for Zone 2.

To facilitate replacements, power, control and instrumentation shall be permitted to be connected through flexible cords,
listed Type TC-ER cable or Type TC-ER-HL cable, by means of attachment plugs, and receptacles, provided that all of the
following conditions apply:

- Attachment plug and receptacle are listed for use in Class I, Zone 2 locations and for use with flexible cords, Type TC-ER
cable or Type TC-ER-HL cable, as applicable, and shall be of the locking and grounding type.

National Fire Protection Association Report
Exception: A Class I, Zone 2 listing is not required if the circuit type of protection is "ia", "ib", or "ic".

- Unless the attachment plug and receptacle are interlocked mechanically or electrically, or otherwise designed so that they cannot be separated when the contacts are energized and the contacts cannot be energized when the plug and socket outlet are separated, a switch listed for the location is provided so that the attachment plug or receptacle is not depended on to interrupt current.

Exception: A switch is not required if the circuit type of protection is "ia", "ib", or "ic".

The flexible is type "ia," "ib," or "ic" protection, in which case the switch is not required.

(2) The current does not exceed 3 amperes at 120 volts, nominal.

(3) The power-supply, cord does not exceed 900 mm (3 ft), is of a type listed for extra-hard usage or for hard usage if protected by location, if applicable.

- Type TC-ER cable or Type TC-ER-HL cable is installed in accordance with the provisions of Article 336, including the restrictions of 336.10(7), if applicable and is supplied through an attachment plug and receptacle of the locking and grounding type.

(4) Only necessary receptacles are provided.

Unless the attachment plug and receptacle are interlocked mechanically or electrically, or otherwise designed so that they cannot be separated when the contacts are energized and the contacts cannot be energized when the plug and socket outlet are separated, the instrumentation receptacle carries a label warning against unplugging under load.

Statement of Problem and Substantiation for Public Comment

Type TC-ER-HL is not a flexible cord or flexible cable. It is a Chapter 3 wiring method, and it is inappropriate to use this cable type in place of flexible cord products and associated equipment that is intended for the use. The suggested revisions in this comment will return the text to the language found in the 2014 NEC.

Committee Statement

Committee Action: Rejected
| Resolution: | First Revision 3968 was made with due regard for the need for flexible wiring and termination methods to facilitate maintenance and repair. The comment does not technically substantiate any safety concern with the specific language other than to disagree with the approach taken. As such, the panel does not support returning to the 2014 language as proposed. |
506.2 Definitions.

For purposes of this article, the following definitions apply.

**Informational Note:** Informational Note: For further information, see ANSI NFPA 496-2013, Standard for Purged and Pressurized Enclosures for Electrical Equipment.

**Protection by Encapsulation "m".**

Type of protection where electrical parts that could cause ignition of a mixture of combustible dust or fibers/flyings in air are protected by enclosing them in a compound in such a way that the explosive atmosphere cannot be ignited.

**Informational Note No. 1:** For additional information, see ANSI ISA-60079-18 - (12.03.01) - 2009 - 2012, Explosive atmospheres — Part 18: Equipment protection by encapsulation “m”; ANSI/UL 60079-19: 2009 2012: Explosive atmospheres — Part 18: Equipment protection by encapsulation “m”; and ANSI/ISA-61241-18 - (12.10.07) - 2011 - 2012, Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Encapsulation “m D.”

Informational Note No. 2: Encapsulation is designated level of protection “maD” or “ma” for use in Zone 20 locations. Encapsulation is designated level of protection “mbD” or “mb” for use in Zone 21 locations. Encapsulation is designated type of protection “mc” for use in Zone 22 locations.

**Protection by Enclosure “t”**.

Type of protection for explosive dust atmospheres where electrical apparatus is provided with an enclosure providing dust ingress protection and a means to limit surface temperatures.

**Informational Note No. 1:** For additional information, see ANSI ISA-60079-31 - (12.10.03) - 2009 - 2014, Explosive Atmospheres — Part 31: Equipment Dust Ignition Protection by Enclosure “t”; and ANSI ISA-61241-1 - (12.10.03) - 2011, Electrical Apparatus for Use in Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Enclosure “t”.

Informational Note No. 2: Protection by enclosure is designated level of protection “ta” for use in Zone 20 locations. Protection by enclosure is designated level of protection “tb” or “tD” for use in Zone 21 locations. Protection by enclosure is designated level of protection “tc” or “tD” for use in Zone 22 locations.

**Protection by Intrinsic Safety “iD.”**

Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of combustible dust, fibers, or flyings in air under prescribed test conditions.

**Informational Note No. 1:** For additional information, see ANSI ISA - 60079-11 - (12.01.01) - 2011, Electrical Apparatus for Explosive Gas - 2013, Explosive Atmospheres — Part 11: Intrinsic safety “i”; ANSI UL 60079-11-2011 2015, Electrical Apparatus for Explosive Gas Atmospheres — Part 11: Equipment Protection by Intrinsic safety “i”; and ANSI ISA - 61241-11 - (12.10.04) - 2011, Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 (Classified) Locations — Protection by Intrinsic Safety “iD.”

Informational Note No. 2: Intrinsic safety is designated level of protection “iaD” or “ia” for use in Zone 20 locations. Intrinsic safety is designated level of protection “ibD” or “ib” for use in Zone 21 locations. Intrinsic safety is designated type of protection “ic” for use in Zone 22 locations.

**Protection by Pressurization “p”**.

Type of protection that guards against the ingress of a mixture of combustible dust or fibers/flyings in air into an enclosure containing electrical equipment by providing and maintaining a protective gas atmosphere inside the enclosure at a pressure above that of the external atmosphere.

**Informational Note:** For additional information, see ANSI ISA-61241-2 - (12.10.06) - 2006 - 2011, Electrical Apparatus for Use in Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Pressurization “pD.”

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3903-NFPA 70-2015
Statement: The informational note referencing ANSI/NFPA 496 was deleted as the informational note should have been relocated to Art. 100 with the term 'Pressurized' under FR 3924.

The documents referenced in 506.2 have been revised to reflect the correct title, numeric designation, ANSI approval and publication dates.

Reference to ANSI/UL 60079-31-2015 was added and replaced the ANSI/ISA 60079-31-2009 standard
Public Comment No. 569-NFPA 70-2015 [Section No. 506.4(B)]

(B) Reference Standards.

Important information relating to topics covered in Chapter 5 can be found in other publications.

Informational Note No. 1: It is important that the authority having jurisdiction be familiar with the recorded industrial experience as well as with standards of the National Fire Protection Association (NFPA), the International Society of Automation (ISA), and the International Electrotechnical Commission (IEC) that may be of use in the classification of various locations, the determination of adequate ventilation, and the protection against static electricity and lightning hazards.

Informational Note No. 2: For additional information concerning the installation of equipment utilizing optical emissions technology (such as laser equipment) that could potentially become an ignition source in hazardous (classified) locations, see ANSI/ISA-60079-28 (12.21.02)-2013, Explosive Atmospheres — Part 28: Protection of equipment and transmission systems using optical radiation.

Statement of Problem and Substantiation for Public Comment

Regarding Informational Note 2: While potential risks of ignition from electrical equipment utilizing optical emissions technology may exist, the design and use of suitable electrical equipment used in hazardous classified locations is already addressed in the NEC. Optical emissions are not within the scope of the NEC. Therefore there is no need to include this reference in the NEC.

Committee Statement

Committee Action: Rejected
Resolution: The informational note is intended to provide the user with useful information related to the installation and use of electrical equipment installed in Zone 20, 21 or 22 locations when such equipment emits optical radiation in free air.
(2) Zone 21.

A Zone 21 location is a location where one of the following apply:

1. Ignitible concentrations of combustible dust or ignitible fibers/flyings are likely to exist occasionally under normal operating conditions; or
2. Ignitible concentrations of combustible dust or ignitible fibers/flyings may exist frequently because of repair or maintenance operations or because of leakage; or
3. Equipment is operated or processes are carried on, of such a nature that equipment breakdown or faulty operations could result in the release of ignitable concentrations of combustible dust or ignitible fibers/flyings and also cause simultaneous failure of electrical equipment in a mode to cause the electrical equipment to become a source of ignition; or
4. Adjacent to a Zone 20 location from which ignitible concentrations of dust or ignitible fibers/flyings could be communicated, unless communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

Informational Note No. 1: As a guide to classification of Zone 21 locations, refer to ANSI/ISA-60079-10-2 (12.10.05)-2013, Explosive Atmospheres — Part 10-2: Classification of areas — Combustible dust atmospheres.

Informational Note No. 2: This classification usually includes locations outside dust containment and in the immediate vicinity of access doors subject to frequent removal or opening for operation purposes when internal combustible mixtures are present; locations outside dust containment in the proximity of filling and emptying points, feed belts, sampling points, truck dump stations, belt dump over points, etc., where no measures are employed to prevent the formation of combustible mixtures; locations outside dust containment where dust accumulates and where due to process operations the dust layer is likely to be disturbed and form combustible mixtures; locations inside dust containment where explosive dust clouds are likely to occur (but neither continuously, nor for long periods, nor frequently) as, for example, silos (if filled and/or emptied only occasionally) and the dirty side of filters if large self-cleaning intervals are occurring.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that list item (4) in this First Revision be rewritten to comply with the NEC Style Manual.

Submittal Date: Tue Sep 29 09:34:23 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3904-NFPA 70-2015
Statement: At the direction of the Correlating Committee, the text of 506.5(B)(2)(4) was revised in accordance with the NEC Style Manual.
Zone 22.

A Zone 22 location is a location where one of the following apply:

1. Ignitible concentrations of combustible dust or ignitable fibers/flyings are not likely to occur in normal operation and, if they do occur, will only persist for a short period; or
2. Combustible dust or fibers/flyings are handled, processed, or used but in which the dust or fibers/flyings are normally confined within closed containers of closed systems from which they can escape only as a result of the abnormal operation of the equipment with which the dust or fibers/flyings are handled, processed, or used; or
3. Adjacent to a Zone 21 location, from which ignitible concentrations of dust or fibers/flyings could be communicated, unless such communication is prevented by adequate positive pressure ventilation from a source of clean air and effective safeguards against ventilation failure are provided.

Informational Note No. 1: As a guide to classification of Zone 22 locations, refer to ANSI/ISA-60079-10-2 12.10.05-2013, Explosive Atmospheres — Part 10-2: Classification of areas — Combustible dust atmospheres.

Informational Note No. 2: Zone 22 locations usually include outlets from bag filter vents, because in the event of a malfunction there can be emission of combustible mixtures; locations near equipment that has to be opened at infrequent intervals or equipment that from experience can easily form leaks where, due to pressure above atmospheric, dust will blow out; pneumatic equipment, flexible connections that can become damaged, etc.; storage locations for bags containing dusty product, since failure of bags can occur during handling, causing dust leakage; and locations where controllable dust layers are formed that are likely to be raised into explosive dust–air mixtures. Only if the layer is removed by cleaning before hazardous dust–air mixtures can be formed is the area designated unclassified.

Informational Note No. 3: Locations that normally are classified as Zone 21 can fall into Zone 22 when measures are employed to prevent the formation of explosive dust–air mixtures. Such measures include exhaust ventilation. The measures should be used in the vicinity of (bag) filling and emptying points, feed belts, sampling points, truck dump stations, belt dump over points, etc.

Statement of Problem and Substantiation for Public Comment

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3905-NFPA 70-2015
Statement: At the direction of the Correlating Committee, the text of 506.5(B)(3)(3) was revised in accordance with the NEC Style Manual.
A Group IIIC.

Remove this term "Combustible metal dust." and replace it with the following:

Atmospheres containing metallic combustible dust including aluminum, magnesium, and their commercial alloys, or other combustible dusts whose particle size, abrasiveness, and conductivity present similar hazards in the use of electrical equipment.

Retain current informational note

Informational note: Group IIIC is equivalent to Class II, Group E as described in 500.6(B)(1).

Statement of Problem and Substantiation for Public Comment

The Committee statement stated: "CMP-14 reaffirms the existing text of the material group definitions based on the current alignment of the published area classification documents, product standards and installation documents."

If IEC, ISA and NFPA represent the significant publishers of area classification documents, as indicated below except for one case, which does not support this application, the term 'combustible metal dust' is not defined.

The informational note contains extremely important information, but due to the style manual, is not part of the definition and it really needs to be part of this description.

The recommended comment change first uses the specific term 'metallic combustible dust' found in the ANSI/ISA document. This change also includes the important aspects of Group E materials in the phrase "including aluminum ...". Since the IEC uses the term 'conductive dust', the aspect of the IEC is also addressed by including the term 'conductivity'. This then truly represents not only an alignment of the published classification documents but a truly understandable and applicable term which is directly traceable to published classification documents.

Exhibit 1 - IEC classification document

The current published IEC classification document addresses dusts specifically under 4.2 Area classification procedure for explosive atmospheres stating:

Area classification is based on a number of factors and may require informed input from a number of sources. These factors include:

• Whether the dust is combustible or not. Dust combustibility can be confirmed by laboratory tests to the future IEC 60079-20-2.

Additionally it states-

a) The first step is to identify whether the material is combustible and, for the purpose of assessment of ignition sources, determine the material characteristics, such as particle size, moisture content, cloud and layer minimum ignition temperature and electrical resistivity, and the appropriate dust group, Group IIIA for combustible flyings, Group IIIB for non-conductive dust, or Group IIIC for conductive dust.

The IEC defined term 'conductive dust' is –

Combustible dust with electrical resistivity equal to or less than 103 Ωm

The IEC defined term for non-conductive dust is –

Combustible dust with electrical resistivity greater than 103 Ωm

The IEC defined term for combustible dust is –

Finely divided solid particles, 500 μm or less in nominal size, which may be suspended in air, may settle out of the atmosphere under their own weight, can burn or glow in air, and may form explosive mixtures with air at atmospheric pressure and normal temperatures

NOTE 1 This definition may also include dust and grit as defined in ISO 4225.

NOTE 2 The term 'solid particle' is intended to address particles in the solid phase and not the gaseous or liquid phase, but does not preclude a hollow particle.

Exhibit 2 - ISA classification

The current published USA ISA classification document addresses dust specifically under 4.2 Area classification procedure for explosive atmospheres stating, with US deviations shown with strikeout and underlines:

Area classification is based on a number of factors and may require informed input from a number of sources. These factors include:

• Whether or not the material is a combustible dust or not. Dust combustibility explosibility can be confirmed by laboratory tests to the ANSI/ASTM E1226 future IEC 60079-20-2.

Additionally it states-

a) The first step is to identify whether the material is combustible and, for the purpose of assessment of ignition sources, determine
the material characteristics, such as particle size, moisture content, cloud and layer minimum ignition temperature and electrical resistivity, and the appropriate dust group, Group IIIA for combustible flyings, Group IIIB for non-conductive dust, or Group IIIC for conductive dust.

NOTE The 2011 ANSI/NFPA 70 (NEC®) does not differentiate selection and installation requirements based on dust groups for Zone 20, Zone 21 and Zone 22 installations.

The ISA Defined term ‘conductive dust’ is —
metallic combustible dust with electrical resistivity equal to or less than 103 Ωm

NOTE The term “conductive dust” is not considered to be the proper technical designation of “metallic dust” but is maintained to support consistency across the ANSI/ISA -60079 documents at this time.

NFPA 70, Article 500.6 B (1)- states:
Group E. Atmospheres containing combustible metal
dusts, including aluminum, magnesium, and their commercial alloys, or other combustible dusts whose particle size, abrasiveness, and conductivity present similar hazards in the use
of electrical equipment. [499:3.3.4.1]

NFPA 484, defines Combustible Metal Dusts as:
A combustible particulate metal that presents a fire or explosion hazard when suspended in air or the process specific oxidizing medium over a range of concentrations, regardless of particle size or shape.
Since Article 506 only pertains to air atmospheres, this definition which includes oxidizing medium over a range of concentrations, is not considered to be valid.

Group IIIB.

Remove this statement: Combustible dust other than combustible metal dust.

Add the following replacement:

Atmospheres containing non-metallic combustible dusts, including flour, grain, wood, plastic, and chemicals, and combustible carbonaceous dusts that have more than 8 percent total entrapped volatiles (see ASTM D 3175-02, Standard Test Method for Volatile Matter in the Analysis Sample for Coal and Coke, for coal and coke dusts) or that have been sensitized by other materials so that they present an explosion hazard. Coal, carbon black, charcoal, and coke dusts are examples of carbonaceous dusts.

Retain the Informational Note:

Informational Note: Group IIIB is equivalent to Class II, Groups F and G as described in 500.6(B)(2) and 500.6(B)(3), respectively.

Statement of Problem and Substantiation for Public Comment

Listings do not specify labeling as defined by the NEC, labeling requirements are determined by the certification organization.

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Committee Statement

Committee Action: Rejected

Resolution: “Listed” and “labeled” are defined separately in Art. 100. Listed is the correct term. Requirements for product listing, to include the affixing of a certification label or mark are specified by certification organizations. Whereas the two certification organizations cited do require listed products to bear a certification mark, these requirements may vary between other organizations.
(2) Zone Equipment.

Equipment meeting one or more of the protection techniques described in 506.8 shall be marked with the following in the order shown:

(1) Zone
(2) Symbol “AEx”
(3) Protection technique(s) in accordance with Table 506.9(C)(2)(3)
(4) Material group in accordance with 506.6 or a specific dust or ignitible fiber/flying or a specific combination thereof
(5) Maximum surface temperature in accordance with 506.9(D), marked as a temperature value in degrees C, preceded by “T” and followed by the symbol “°C”
(6) Ambient temperature marking in accordance with 506.9(D)

Informational Note: The EPL (or equipment protection level) can appear in the product marking. EPLs are designated as G for gas, D for dust, or M for mining, and are then followed by a letter (a, b, or c) to give the user a better understanding as to whether the equipment provides either (a) a “very high,” (b) a “high,” or (c) an “enhanced” level of protection against ignition of an explosive atmosphere. For example, a Zone 21 AEx pb IIIB T165°C motor can additionally be marked with an EPL of “Db”, Zone 21 AEx p IIIB T165°C Db.

Exception: Associated apparatus NOT suitable for installation in a hazardous (classified) location shall be required to be marked only with 506.9(C)(2)(2) and (3), and where applicable (4), but BOTH the symbol AEx in 506.9(C)(2)(2) and the symbol for the type of protection in 506.9(C)(2)(3) shall be enclosed within the same square brackets; for example, [AEx iaD] or [AEx ia] IIIIC.

*Does not address use where a combination of techniques is used.

**Associated apparatus is permitted to be installed in a hazardous (classified) location if suitably protected using another type of protection.

Informational Note: The “D” suffix on the type of protection designation was employed prior to the introduction of Group IIIA, IIIB, and IIIC; which is now used to distinguish between the type of protection employed for Group II (Gases) or Group III (Dusts).
### Statement of Problem and Substantiation for Public Comment

Remove the addition of the words "or a specific dust or ignitable fiber/flying or a specific combination thereof". The additional provision only creates confusion for the installers and inspectors. The "specific dust" that the device maybe approved for will not likely appear on the label and will be only in some documentation. Current product standards do not permit the listing, testing or approval of specific dusts.

(1) Equipment Provided with Threaded Entries for NPT-Threaded Conduit or Fittings.

For equipment provided with threaded entries for NPT-threaded conduit or fittings, listed conduit fittings or listed cable fittings shall be used. All NPT-threaded conduit and fittings shall be threaded with a National (American) Standard Pipe Taper (NPT) thread.

Informational Note: Thread specifications for NPT threads are located in ANSI/ASME B1.20.1-2013, Pipe Threads, General Purpose (Inch).

Statement of Problem and Substantiation for Public Comment

Referenced correct SDO name.

State: 
Zip: 
Submittal Date: Wed Jul 08 19:43:35 EDT 2015

Committee Statement

Committee Action: Rejected
513.1 Scope.

This article shall apply to buildings or structures in any part of which aircraft containing Class I (flammable) liquids or Class II (combustible) liquids whose temperatures are above their flash points are housed or stored and in which aircraft might undergo service, repairs, or alterations. It shall not apply to locations used exclusively for aircraft that have never contained fuel or unfueled aircraft.

Informational Note No. 1: For definitions of aircraft hangar and unfueled aircraft, see NFPA 409-2011, Standard on Aircraft Hangars.

Informational Note No. 2: For further information on fuel classification see NFPA 30-2015, Flammable and Combustible Liquids Code.

Statement of Problem and Substantiation for Public Comment

As written, the paragraph is confusing and contradicts Article 500.5. The scope appears to allow standard electrical equipment to be installed and used in an aircraft hangar with fueled aircraft as long as the ambient temperature never reaches the flash point of the fuel. Article 500.5 defines Classified Locations regardless of temperatures. The proposed change aligns it with Article 500.5 and meets the intent of NFPA 409.

1For marine application, grade level means the surface of a pier, extending down to water level.

2Refer to Figure 514.3(a) and Figure 514.3(b) for an illustration of classified location around dispensing devices.

3Area classification inside the dispenser enclosure is covered in UL 87, Standard for Power-Operated Dispensing Devices for Petroleum Products.

4Ceiling-mounted hose reel. [30A:Table 8.3.1]
Compressed Natural Gas, Liquefied Natural Gas, and Liquefied Petroleum Gas Areas.

Table 514.3(B)(2) shall be used to delineate and classify areas where CNG, LNG, compressed or liquefied hydrogen, LP-Gas, or combinations of these, are dispensed as motor vehicle fuels along with Class I or Class II liquids that are also dispensed as motor vehicle fuels. [30A:12.1]

Where CNG or LNG dispensers are installed beneath a canopy or enclosure, either the canopy or enclosure shall be designed to prevent accumulation or entrapment of ignitable vapors or all electrical equipment installed beneath the canopy or enclosure shall be suitable for Class I, Division 2 hazardous (classified) locations. [30A:12.4]

Dispensing devices for LP-Gas shall be located as follows:

1. At least 3 m (10 ft) from any dispensing device for Class I liquids.
2. At least 1.5 m (5 ft) from any dispensing device for Class I liquids where the following conditions exist:
   3. The LP-Gas deliver nozzle and filler valve release no more than 4 cm³ (0.1 oz) of liquid upon disconnection.
   4. The fixed maximum liquid level gauge remains closed during the entire refueling process.

[30A:12.5.2]

Informational Note No. 3: See 514.3(C) for motor fuel dispensing stations in marinas and boatyards.

|                                  | **Class I, Division 2**
|                                  | Up to 450 mm (18 in.) above ground and within 6 m (20 ft) horizontally from any edge of the dispenser enclosure, including pits or trenches within this area when provided with adequate mechanical ventilation |

[30A:Table 12.6.2]
(3) Fuel Storage.

(a) Aboveground tanks storing CNG or LNG shall be separated from any adjacent property line that is or can be built upon, any public way, and the nearest important building on the same property. [30A:12.3.1]

Informational Note: The relevant distances are given in Section 8.4 of NFPA 52-2013, Vehicular Gaseous Fuel Systems Code.

(b) Aboveground tanks storing hydrogen shall be separated from any adjacent property line that is or can be built upon, any public way, and the nearest important building on the same property. [30A:12.3.2]

Informational Note: The relevant distances given in NFPA 2-2011, Hydrogen Technologies Code.

(c) Aboveground tanks storing LP-Gas shall be separated from any adjacent property line that is or can be built upon, any public way, and the nearest important building on the same property. [30A:12.3.3]

Informational Note: The relevant distances are given in Section 6.3 of NFPA 58-2014, Liquefied Petroleum Gas Code.

(d) Aboveground tanks storing CNG, LNG, or LP-Gas shall be separated from each other by at least 6 m (20 ft) and from dispensing devices that dispense liquid or gaseous motor vehicle fuels by at least 6 m (20 ft). [30A:12.3.3]

Exception No. 1: The required separation shall not apply to tanks or dispensers storing or handling fuels of the same chemical composition.

Exception No. 2: The required separation shall not apply when both the gaseous fuel storage and dispensing equipment are at least 15 m (50 ft) from any other aboveground motor fuel storage or dispensing equipment.

Informational Note: For further information, see NFPA 52-2013, Vehicular Gaseous Fuel Systems Code, or NFPA 58-2014, Liquefied Petroleum Gas Code, as applicable.

(e) Dispenser Installations Beneath Canopies. Where CNG or LNG dispensers are installed beneath a canopy or enclosure, either the canopy or enclosure shall be designed to prevent accumulation or entrapment of ignitible vapors or all electrical equipment installed beneath the canopy or enclosure shall be suitable for Class I, Division 2 hazardous (classified) locations. [30A:12.4]

(f) Specific Requirements for LP-Gas Dispensing Devices. [30A:12.5] Dispensing devices for LP-Gas shall be located as follows:

(7) At least 3 m (10 ft) from any dispensing device for Class I liquids

(8) At least 1.5 m (5 ft) from any dispensing device for Class I liquids where the following conditions exist:

(9) The LP-Gas deliver nozzle and filler valve release no more than 4 cm³ (0.1 oz) of liquid upon disconnection.

(10) The fixed maximum liquid level gauge remains closed during the entire refueling process. [30A:12.5.2]

Table 514.3(B)(2) shall be used to delineate and classify areas for the purpose of installation of electrical wiring and electrical utilization equipment.

514.8 Revision of sealing underground conduits in a classified location

Conduits that are installed to serve a classified area must be sealed within 10' of the point of emergence if the point of emergence is in an unclassified area. Conduits that run within the same classified area are not required to be sealed as they emerge from the ground. Conduits that serve a div 1 area and emerge in a div 2 area must be sealed within 10' of the point of emergence. The seal may be at either end as per 501.15(A)(4) and (B)(2) Conduits that run under a classified area that do not emerge in the classified area do not require sealing if the installation is for compressed natural gas.

Revision of exception #2

Exception #2 add the following:
The grounding conductor is not required to be installed within the conduit if both ends are effectively grounded and bonded and the conductors or cables within the conduit are for communications and are not current carrying. The installation must comply with 250.6

Statement of Problem and Substantiation for Public Comment

The way 514.8 is written, it requires a seal on both ends of a conduit that runs under and serves a classified area. Conduits that run above grade in a classified area from point a to point b do not require a seal if within the same area, but if buried underground (to eliminate a trip hazard) a seal would be required at both ends to comply with the way 514.8 is written. The change would clarify the requirement and agree with 501.15

When the installation is compressed natural gas, there are no fitting’s underground on the high pressure gas line. If ruptured, the gas is expelled into the atmosphere. It does not seep into the soil as with liquid fuel. The entrance of compressed natural gas into an underground electrical conduit that does not serve the classified area is unlikely.

Revision of exception #2
Ethernet or CAT 5 cables interconnect PLC’s and modems plus connect dispensers to monitoring equipment and point of sales equipment.

If a grounding conductor was run with a CAT 5 cable and it was connected to other grounding conductors for power or control wiring at the load there could be objectionable current imposed on the ground wire when a ground fault is being cleared. This will induce a voltage on a CAT 5 cable and would damage PLC’s, modems, or other equipment. If the requirements of 250.6 are met a grounding conductor can be eliminated. Some inspectors require the grounding conductor even though it will damage equipment just because the 514.8 requires it. They do not recognize 250.6 and say 514.8 takes president over 250.6.

Submitter Verification

Submitter Full Name: GERALD DALEY
Organization: Daley Electric Company
Street Address:
City:
State:
Zip:
Submittal Date: Wed Jul 22 16:42:41 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: There is no substantiation to make a change in the text of 514.8. Seals are installed to prevent gases from using the conduit as a pathway. Buried conduits above High Pressure Gas lines could have gases enter and travel upward through the conduit system. Grounding conductors are required.
Use of seal in dispenser
The first seal fitting emerging from the ground inside the dispenser may serve as the boundary seal in Compressed Natural gas installations.

Statement of Problem and Substantiation for Public Comment

514.9 requires a seal at the dispenser. The purpose of this seal is unclear. Where a dispenser has a conduit entering from an unclassified area or a div 2 area the seal in the dispenser should be acceptable as the boundary seal identified in 501.15 (A) (4) and (B) (2)

Submittal Date: Wed Jul 22 17:04:49 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: It is unclear why the submitter wants to use the seal as the required dispenser seal and the boundary seal. There is no technical substantiation for this change. The code allows a common seal for multiple purposes.
Title of New Content NFPA 70: 514 (D)

Type your content here ... Where facilities have fire alarm systems installed, motor fueling facilities with fire alarm systems shall have the emergency circuits for the emergency disconnects interconnected with the fire alarm system.

Statement of Problem and Substantiation for Public Comment

There is not a current mandate for such interconnection between the emergency stops for the fueling pumps and the fire alarm system of the fueling station. When this connection is incorporated, the fueling pumps shut off when the fire alarm is activated. Customers could be actively fueling vehicles when the fire alarm is activated, without the interconnection, the vehicles could continue to actively be fueled (fuel dispensing could continue).

By emergency stop activation combined with the fire alarms system, the potential for creating a greater incident could be lessened.

Submittal Date: Wed Jul 22 14:35:35 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: This requirement is not within the scope of Article 514 of the NEC. This is more appropriately addressed by NFPA 30A and NFPA 72.
515.3 Class I Locations.
Table 515.3 shall be applied where Class I liquids are stored, handled, or dispensed and shall be used to delineate and classify bulk storage plants. The class location shall not extend beyond a floor, wall, roof, or other solid partition that has no communicating openings. [30:7.3, 7.4]

Informational Note No. 1: The area classifications listed in Table 515.3 are based on the premise that the installation meets the applicable requirements of NFPA 30-2015, Flammable and Combustible Liquids Code, Chapter 5, in all respects. Should this not be the case, the authority having jurisdiction has the authority to classify the extent of the classified space.

Informational Note No. 2: See 514.3(C) through (E) for gasoline dispensing stations in marinas and boatyards.

</table>

1 The release of Class I liquids can generate vapors to the extent that the entire building, and possibly an area surrounding it, should be considered a Class I, Division 2 or Zone 2 location.

2 When classifying extent of area, consideration shall be given to the fact that tank cars or tank vehicles can be spotted at varying points. Therefore, the extremities of the loading or unloading positions shall be used. [30: Table 7.3.3]

### Committee Statement

- **Committee Action:** Accepted
- **Resolution:** SR-3929-NFPA 70-2015
- **Statement:** The term ordinary is not a defined area but the term unclassified is. Section 3.2.7.3.2 of the NEC Style Manual allows edits to extracted material to make style consistent with the NEC.
Article 516  Spray Application, Dipping, Coating, and Printing Processes Using Flammable or Combustible Materials

Informational Note: Text that is followed by a reference in brackets has been extracted from NFPA 33-2015, Standard for Spray Application Using Flammable and Combustible Materials, or NFPA 34-2015, Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids. Only editorial changes were made to the extracted text to make it consistent with this Code.

Part I. General

516.1  Scope.

This article covers the regular or frequent application of flammable liquids, combustible liquids, and combustible powders by spray operations and the application of flammable liquids, or combustible liquids at temperatures above their flashpoint, by spraying, dipping, coating, printing, or other means.

Informational Note: For further information regarding safeguards for these processes, such as fire protection, posting of warning signs, and maintenance, see NFPA 33-2015, Standard for Spray Application Using Flammable and Combustible Materials, and NFPA 34-2015, Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids. For additional information regarding ventilation, see NFPA 91-2010, Standard for Exhaust Systems for Air Conveying of Vapors, Gases, Mists, and Noncombustible Particulate Solids.

516.2  Definitions.

For the purpose of this article, the following definitions shall apply.

**Limited Finishing Workstation.**
An apparatus that is capable of confining the vapors, mists, residues, dusts, or deposits that are generated by a spray application process and that meets the requirements of Section 14.3 of NFPA 33, Standard for Spray Application Using Flammable or Combustible Materials, but does not meet the requirements of a spray booth or spray room, as herein defined. [33: 3.3.18.1]

**Outdoor Spray Area.**
A spray area that is outside the confines of a building or that has a canopy or roof that does not limit the dissipation of the heat of a fire or dispersion of flammable vapors and does not restrict fire-fighting access and control. For the purpose of this standard, an outdoor spray area can be treated as an unenclosed spray area. [33: 3.3.2.3.1]

**Spray Area.**
Any fully enclosed, partly enclosed, or unenclosed area in which dangerous quantities of flammable or combustible vapors, mists, residues, dusts, or deposits are present due to the operation of spray processes, including (1) any area in the direct path of a spray application process; (2) the interior of a spray booth, spray room, or limited finishing workstation, as herein defined; (3) the interior of any exhaust plenum, eliminator section, or scrubber section; (4) the interior of any exhaust duct or exhaust stack leading from a spray application process; (5) the interior of any air recirculation path up to and including recirculation particulate filters; (6) any solvent concentrator (pollution abatement) unit or solvent recovery (distillation) unit; and (7) the inside of a membrane enclosure. The following are not part of the spray area: (1) fresh air make-up units; (2) air supply ducts and air supply plenums; (3) recirculation air supply ducts downstream of recirculation particulate filters; (4) exhaust ducts from solvent concentrator (pollution abatement) units. [33: 3.3.2.3]

Informational Note: Unenclosed spray areas are locations outside of buildings or are localized operations within a larger room or space. Such are normally provided with some local vapor extraction/ventilation system. In automated operations, the area limits are the maximum area in the direct path of spray operations. In manual operations, the area limits are the maximum area of spray when aimed at 90 degrees to the application surface.

**Spray Booth.**
A power-ventilated enclosure for a spray application operation or process that confines and limits the escape of the material being sprayed, including vapors, mists, dusts, and residues that are produced by the spraying operation and conducts or directs these materials to an exhaust system. [33: 3.3.15]

Informational Note: A spray booth is an enclosure or insert within a larger room used for spray/coating/dipping applications. A spray booth can be fully enclosed or have open front or face and can include separate conveyor entrance and exit. The spray booth is provided with a dedicated ventilation exhaust with supply air from the larger room or from a dedicated air supply.

**Spray Room.**
A power-ventilated fully enclosed room used exclusively for open spraying of flammable or combustible materials. [33: 3.3.16]

**Unenclosed Spray Area.**
Any spray area that is not confined by a limited finishing workstation, spray booth, or spray room, as herein defined. [33: 3.3.2.3.2]
Part II. Open Containers

516.4 Area Classification.

For open containers, supply containers, waste containers, spray gun cleaners, and solvent distillation units that contain Class I liquids that are located in ventilated areas, electrical area classification shall be in accordance with the following:

(1) The area within 915 mm (3 ft) in all directions from any such container or equipment and extending to the floor or grade level shall be classified as Class I, Division 1 or Class I, Zone 1, whichever is applicable. [33: 6.5.5.1]

(2) The area extending 610 mm (2 ft) beyond the Division 1 or Zone 1 location shall be classified as Class I, Division 2 or Class I, Zone 2, whichever is applicable. [33: 6.5.5.1]

(3) The area extending 1525 mm (5 ft) horizontally beyond the area described in 516.4 (b) up to a height of 460 mm (18 in.) above the floor or grade level shall be classified as Class I, Division 2 or Class I, Zone 2, whichever is applicable. [33: 6.5.5.1]

(4) The area inside any tank or container shall be classified as Class I, Division 1 or Class I, Zone 0, whichever is applicable. [33: 6.5.5.1]

(5) Sumps, pits, or below grade channels within 3.5 m (10 ft) horizontally of a vapor source shall be classified as Class I, Division 1 or Zone 1. If the sump, pit, or channel extends beyond 3.5 m (10 ft) from the vapor source, it shall be provided with a vapor stop or it shall be classified as Class I, Division 1 or Zone 1 for its entire length.

For the purposes of electrical area classification, the Division system and the Zone system shall not be intermixed for any given source of release. [33: 6.2.3]

Electrical wiring and utilization equipment installed in these areas shall be suitable for the location, as shown in Figure 516.4.

Figure 516.4 Electrical Area Classification for Class I Liquid Operations Around Open Containers, Supply Containers, Waste Containers, Spray Gun Cleaners, and Solvent Distillation Units. [33: Figure 6.5.5.2]

Part III. Spray Application Processes

516.5 Area Classification.

For spray application processes, the area classification is based on quantities of flammable vapors, combustible mists, residues, dusts, or deposits that are present or might be present in quantities sufficient to produce ignitable or explosive mixtures with air.

(A). Zone Classification of Locations.

(1) Classification of Locations.

The Zone system of electrical area classification shall be applied as follows:

(1) The inside of closed containers or vessels shall be considered a Class I, Zone 0 location.

(2) A Class I, Division 1 location shall be permitted to be alternatively classified as a Class I, Zone 1 location.

(3) A Class I, Division 2 location shall be permitted to be alternatively classified as a Class I, Zone 2 location.

(4) A Class II, Division 1 location shall be permitted to be alternatively classified as a Zone 21 location.

(5) A Class II, Division 2 location shall be permitted to be alternatively classified as a Zone 22 location. [33: 6.2.2]

(2) For the purposes of electrical area classification, the Division system and the Zone system shall not be intermixed for any given source of release. [33: 6.2.3]
In instances of areas within the same facility classified separately, Class I, Zone 2 locations shall be permitted to abut, but not overlap. Class I, Division 2 locations. Class I, Zone 0 or Zone 1 locations shall not abut Class I, Division 1 or Division 2 locations. [70: 505.7(B)] [33: 6.2.4]

Open flames, spark-producing equipment or processes, and equipment whose exposed surfaces exceed the autoignition temperature of the material being sprayed shall not be located in a spray area or in any surrounding area that is classified as Division 2, Zone 2, or Zone 22. [33: 6.2.5]

Exception: This requirement shall not apply to drying, curing, or fusing apparatus.

Any utilization equipment or apparatus that is capable of producing sparks or particles of hot metal and that is located above or adjacent to either the spray area or the surrounding Division 2, Zone 2, or Zone 22 areas shall be of the totally enclosed type or shall be constructed to prevent the escape of sparks or particles of hot metal. [33: 6.2.6]

(B) Class I, Division 1 or Class I, Zone 0 Locations.

The interior of any open or closed container or vessel of a flammable liquid shall be considered Class I, Division 1, or Class I, Zone 0, as applicable:

Informational Note: For additional guidance, see Chapter 6 of NFPA 33-2015, Standard for Spray Application Using Flammable or Combustible Materials.

(C) Class I, Division 1; Class I, Zone 1; Class II, Division 1; or Zone 21 Locations.

The following spaces shall be considered Class I, Division 1; Class I, Zone 1; Class II, Division 1; or Zone 21 locations, as applicable:

1. The interior of spray booths and rooms except as specifically provided in 516.5(D).
2. The interior of exhaust ducts.
3. Any area in the direct path of spray operations.
4. Sumps, pits, or below grade channels within 7.5 m (25 ft) horizontally of a vapor source. If the sump, pit, or channel extends beyond 7.5 m (25 ft) from the vapor source, it shall be provided with a vapor stop or it shall be classified as Class I, Division 1 for its entire length. [34: 6.4.1]
5. All space in all directions outside of but within 900 mm (3 ft) of open containers, supply containers, spray gun cleaners, and solvent distillation units containing flammable liquids.
6. For limited finishing workstations, the area inside the curtains or partitions. (See Figure 516.5(D)(5).)

(D) Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 Locations.

The spaces listed in 516.5(D)(1) through (D)(5) shall be considered Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 as applicable.
(1) **Unenclosed Spray Processes.**

For unenclosed spraying, all space outside of but within 6 m (20 ft) horizontally and 3 m (10 ft) vertically of the Class I, Division 1 or Class I, Zone 1 location as defined in 516.5(A) and not separated from it by partitions. (See Figure 516.5(D)(1) [33: 6.5.1]

*Figure 516.5(D)(1) Electrical Area Classification for Unenclosed Spray Areas. [33:Figure 6.5.1]*

![Diagram of unenclosed spray area](image)
Closed-Top, Open-Face, and Open-Front Spray Booths and Spray Rooms

If spray application operations are conducted within a closed-top, open-face, or open-front booth or room, as shown in Figure 516.5(D)(2), any electrical wiring or utilization equipment located outside of the booth or room but within 915 mm (3 ft) of any opening shall be suitable for Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 locations, whichever is applicable. The Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 locations shown in Figure 516.5(D)(2) shall extend from the edges of the open face or open front of the booth or room.

Figure 516.5(D)(2) Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 Locations Adjacent to a Closed Top, Open Face, or Open Front Spray Booth or Room. [33:Figure 6.5.2]

Open-Top Spray Booths

For spraying operations conducted within an open top spray booth, the space 915 mm (3 ft) vertically above the booth and within 915 mm (3 ft) of other booth openings shall be considered Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 whichever is applicable. [33:6.5.3]

Enclosed Spray Booths and Spray Rooms

For spray application operations confined to an enclosed spray booth or room, electrical area classification shall be as follows: [33:6.5.4]

1. The area within 915 mm (3 ft) of any opening shall be classified as Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 whichever is applicable, as shown in Figure 516.5(D)(4). [33:6.5.4]

2. Where automated spray application equipment is used, the area outside the access doors shall be unclassified provided the door interlock prevents the spray application operations when the door is open.

3. Where exhaust air is permitted to be recirculated, both of the following shall apply:

   4. The interior of any recirculation path from the secondary particulate filters up to and including the air supply plenum shall be classified as Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 locations, whichever is applicable.

   5. The interior of fresh air supply ducts shall be unclassified. [33:6.5.4]

6. Where exhaust air is not recirculated, the interior of fresh air supply ducts and fresh air supply plenums shall be unclassified. [33:6.5.4]
(5) Limited Finishing Workstations.

For limited finishing workstations, the area inside the 915 mm (3 ft) space horizontally and vertically beyond the volume enclosed by the outside surface of the curtains or partitions shall be classified as Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22, as shown in Figure 516.5(D)(5).

Figure 516.5(D)(4) Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 Locations Adjacent to an Enclosed Spray Booth or Spray Room. [33 Figure 6.5.4]

Figure 516.5(D)(5) Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 Locations Adjacent to an Enclosed Spray Booth or Spray Room. [33 Figure 14.3.5.1]

516.6 Wiring and Equipment in Class I Locations.
(A) Wiring and Equipment — Vapors.

All electrical wiring and equipment within the Class I location (containing vapor only — not residues) defined in 516.5 shall comply with the applicable provisions of Article 501 or Article 505, as applicable.

(B) Wiring and Equipment — Vapors and Residues.

Unless specifically listed for locations containing deposits of dangerous quantities of flammable or combustible vapors, mists, residues, dusts, or deposits (as applicable), there shall be no electrical equipment in any spray area as herein defined whereon deposits of combustible residue may readily accumulate, except wiring in rigid metal conduit, intermediate metal conduit, Type MI cable, or in metal boxes or fittings containing no taps, splices, or terminal connections. [33: 6.4.2]
Luminaires shall be permitted to be installed as follows:

1. Luminaires, like that shown in Figure 516.6(C)(a), that are attached to the walls or ceiling of a spray area but that are outside any classified area and are separated from the spray area by glass panels shall be suitable for use in unclassified locations. Such fixtures shall be serviced from outside the spray area. [33: 6.6.1]

2. Luminaires, like that shown in Figure 516.6(C)(a), that are attached to the walls or ceiling of a spray area; that are separated from the spray area by glass panels and that are located within a Class I, Division 2; a Class I, Zone 2; a Class II, Division 2; or a Zone 22 location shall be suitable for such location. Such fixtures shall be serviced from outside the spray area. [33: 6.6.2]

3. Luminaires, like that shown in Figure 516.6(C)(b), that are an integral part of the walls or ceiling of a spray area shall be permitted to be separated from the spray area by glass panels that are an integral part of the fixture. Such fixtures shall be listed for use in Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 locations, whichever is applicable, and also shall be listed for accumulations of deposits of combustible residues. Such fixtures shall be permitted to be serviced from inside the spray area. [33: 6.6.3]

4. Glass panels used to separate luminaires from the spray area or that are an integral part of the luminaire shall meet the following requirements:
   
   5. Panels for light fixtures or for observation shall be of heat-treated glass, laminated glass, wired glass, or hammer-wired glass and shall be sealed to confine vapors, mists, residues, dusts, and deposits to the spray area. [33: 5.5.1]

   Exception: Listed spray booth assemblies that have vision panels constructed of other materials shall be permitted.

   6. Panels for light fixtures shall be separated from the fixture to prevent the surface temperature of the panel from exceeding 93°C (200°F). [33: 5.5.2]

   7. The panel frame and method of attachment shall be designed to not fail under fire exposure before the vision panel fails. [33: 5.5.3]

Figure 516.6(C)(a) Example of a Luminaire that is Mounted Outside of the Spray Area and is Serviced from Outside the Spray Area. [33: Figure 6.6.1]

Figure 516.6(C)(b) Example of a Luminaire that is an Integral Part of the Spray Area and is Serviced from Inside the Spray Area. [33: Figure 6.6.3]
Portable electric luminaires or other utilization equipment shall not be used in a spray area during spray operations.

Exception No. 1: Where portable electric luminaires are required for operations in spaces not readily illuminated by fixed lighting within the spraying area, they shall be of the type identified for Class I, Division 1 or Class 1, Zone 1 locations where readily ignitable residues may be present. [33: 6.9 Exception]

Exception No. 2: Where portable electric drying apparatus is used in spray booths and the following requirements are met:

(a) The apparatus and its electrical connections are not located within the spray enclosure during spray operations.

(b) Electrical equipment within 450 mm (18 in.) of the floor is identified for Class I, Division 2 or Class I, Zone 2 locations.

(c) All metallic parts of the drying apparatus are electrically bonded and grounded.

(d) Interlocks are provided to prevent the operation of spray equipment while drying apparatus is within the spray enclosure, to allow for a 3-minute purge of the enclosure before energizing the drying apparatus and to shut off drying apparatus on failure of ventilation system.

Electrostatic spraying or detearing equipment shall be installed and used only as provided in 516.10.

Informational Note: For further information, see NFPA 33-2015, Standard for Spray Application Using Flammable or Combustible Materials.

All persons and all electrically conductive objects, including any metal parts of the process equipment or apparatus, containers of material, exhaust ducts, and piping systems that convey flammable or combustible liquids, shall be electrically grounded. [34: 6.8.1]

516.7 Wiring and Equipment Not Within Classified Locations.
(A) Wiring.

All fixed wiring above the Class I and II locations shall be in metal raceways, Type PVC conduit, Type RTRC conduit, or electrical nonmetallic tubing; where cables are used, they shall be Type MI, Type TC, or Type MC cable. Cellular metal floor raceways shall only be permitted to supply ceiling outlets or as extensions to the area below the floor of a Class I or II location. Where cellular metal raceways are used, they shall not have connections leading into or passing through the Class I or II location unless suitable seals are provided.

(B) Equipment.

Equipment that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, motors, or other equipment having make-and-break or sliding contacts, where installed above a classified location or above a location where freshly finished goods are handled, shall be of the totally enclosed type or be constructed so as to prevent the escape of sparks or hot metal particles.

516.10 Special Equipment.

(A) Fixed Electrostatic Equipment.

This section shall apply to any equipment using electrostatically charged elements for the atomization, charging, and/or precipitation of hazardous materials for coatings on articles or for other similar purposes in which the charging or atomizing device is attached to a mechanical support or manipulator. This shall include robotic devices. This section shall not apply to devices that are held or manipulated by hand. Where robot or programming procedures involve manual manipulation of the robot arm while spraying with the high voltage on, the provisions of 516.10(B) shall apply. The installation of electrostatic spraying equipment shall comply with 516.10(A)(1) through (A)(10). Spray equipment shall be listed. All automatic electrostatic equipment systems shall comply with 516.6(A) through (E).

1. Power and Control Equipment.

Transformers, high-voltage supplies, control apparatus, and all other electrical portions of the equipment shall be installed outside of the Class I location or be of a type identified for the location.

Exception: High-voltage grids, electrodes, electrostatic atomizing heads, and their connections shall be permitted within the Class I location.

2. Electrostatic Equipment.

Electrodes and electrostatic atomizing heads shall be adequately supported in permanent locations and shall be effectively insulated from ground. Electrodes and electrostatic atomizing heads that are permanently attached to their bases, supports, reciprocators, or robots shall be deemed to comply with this section.

3. High-Voltage Leads.

High-voltage leads shall be properly insulated and protected from mechanical damage or exposure to destructive chemicals. Any exposed element at high voltage shall be effectively guarded against accidental contact or grounding.

Goods being coated using this process shall be supported on conveyors or hangers. The conveyors or hangers shall be arranged (1) to ensure that the parts being coated are electrically connected to ground with a resistance of 1 megohm or less and (2) to prevent parts from swinging.

5. Automatic Controls.

Electrostatic apparatus shall be equipped with automatic means that will rapidly de-energize the high-voltage elements under any of the following conditions:

1. Stoppage of ventilating fans or failure of ventilating equipment from any cause
2. Stoppage of the conveyor carrying goods through the high-voltage field unless stoppage is required by the spray process
3. Occurrence of excessive current leakage at any point in the high-voltage system
4. De-energizing the primary voltage input to the power supply

All electrically conductive objects in the spray area, except those objects required by the process to be at high voltage, shall be adequately grounded. This requirement shall apply to paint containers, wash cans, guards, hose connectors, brackets, and any other electrically conductive objects or devices in the area.

Informational Note: For more information on grounding and bonding for static electricity purposes, see NFPA 33-2015, Standard for Spray Application Using Flammable or Combustible Materials; NFPA 34-2015, Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids; and NFPA 77-2007, Recommended Practice on Static Electricity.

7. Isolation.

Safeguards such as adequate booths, fencing, railings, interlocks, or other means shall be placed about the equipment or incorporated therein so that they, either by their location, character, or both, ensure that a safe separation of the process is maintained.
(8) Signs.

Signs shall be conspicuously posted to convey the following:

(1) Designate the process zone as dangerous with regard to fire and accident.
(2) Identify the grounding requirements for all electrically conductive objects in the spray area.
(3) Restrict access to qualified personnel only.

(9) Insulators.

All insulators shall be kept clean and dry.

(10) Other Than Nonincendive Equipment.

Spray equipment that cannot be classified as nonincendive shall comply with (A)(10)(a) and (A)(10)(b).

(a) Conveyors, hangers, and application equipment shall be arranged so that a minimum separation of at least twice the sparking distance is maintained between the workpiece or material being sprayed and electrodes, electrostatic atomizing heads, or charged conductors. Warnings defining this safe distance shall be posted. [33:11.4.1]

(b) The equipment shall provide an automatic means of rapidly de-energizing the high-voltage elements in the event the distance between the goods being painted and the electrodes or electrostatic atomizing heads falls below that specified in (a). [33:11.3.8]

(B) Hand-Spraying Electrostatic Equipment.

This section shall apply to any equipment using electrostatically charged elements for the atomization, charging, or precipitation of flammable and combustible materials for coatings on articles, or for other similar purposes in which the charging or atomizing device is hand-held and manipulated during the spraying operation. Electrostatic hand-spraying equipment and devices used in connection with paint-spraying operations shall be of listed types and shall comply with 516.10(B)(1) through (B)(5).

(1) General.

The high-voltage circuits shall be designed so as not to produce a spark of sufficient intensity to ignite the most readily ignitable of those vapor–air mixtures likely to be encountered, or result in appreciable shock hazard upon coming in contact with a grounded object under all normal operating conditions. The electrostatically charged exposed elements of the handgun shall be capable of being energized only by an actuator that also controls the coating material supply.

(2) Power Equipment.

Transformers, power packs, control apparatus, and all other electrical portions of the equipment shall be located outside of the Class I location or be identified for the location.

Exception: The handgun itself and its connections to the power supply shall be permitted within the Class I location.

(3) Handle.

The handle of the spraying gun shall be electrically connected to ground by a conductive material and be constructed so that the operator in normal operating position is in electrical contact with the grounded handle with a resistance of not more than 1 megohm to prevent buildup of a static charge on the operator's body. Signs indicating the necessity for grounding other persons entering the spray area shall be conspicuously posted.

(4) Electrostatic Equipment.

All electrically conductive objects in the spraying area, except those objects required by the process to be at high voltage shall be electrically connected to ground with a resistance of not more than 1 megohm. This requirement shall apply to paint containers, wash cans, and any other electrical conductive objects or devices in the area. The equipment shall carry a prominent, permanently installed warning regarding the necessity for this grounding feature.

Informational Note: For more information on grounding and bonding for static electricity purposes, see NFPA 33-2015, Standard for Spray Application Using Flammable or Combustible Materials; NFPA 34-2015, Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids; and NFPA 77, 2007, 2014, Recommended Practice on Static Electricity.

(5) Support of Objects.

Objects being painted shall be maintained in electrical contact with the conveyor or other grounded support. Hooks shall be regularly cleaned to ensure adequate grounding of 1 megohm or less. Areas of contact shall be sharp points or knife edges where possible. Points of support of the object shall be concealed from random spray where feasible; and, where the objects being sprayed are supported from a conveyor, the point of attachment to the conveyor shall be located so as to not collect spray material during normal operation.

(C) Powder Coating.

This section shall apply to processes in which combustible dry powders are applied. The hazards associated with combustible dusts are present in such a process to a degree, depending on the chemical composition of the material, particle size, shape, and distribution.
(1) Electrical Equipment and Sources of Ignition.

Electrical equipment and other sources of ignition shall comply with the requirements of Article 502. Portable electric luminaires and other utilization equipment shall not be used within a Class II location during operation of the finishing processes. Where such luminaires or utilization equipment are used during cleaning or repairing operations, they shall be of a type identified for Class II, Division 1 locations, and all exposed metal parts shall be connected to an equipment grounding conductor.

Exception: Where portable electric luminaires are required for operations in spaces not readily illuminated by fixed lighting within the spraying area, they shall be of the type listed for Class II, Division 1 locations where readily ignitable residues may be present.

(2) Fixed Electrostatic Spraying Equipment.

The provisions of 516.10(A) and 516.10(C)(1) shall apply to fixed electrostatic spraying equipment.

(3) Electrostatic Hand-Spraying Equipment.

The provisions of 516.10(B) and 516.10(C)(1) shall apply to electrostatic hand-spraying equipment.

(4) Electrostatic Fluidized Beds.

Electrostatic fluidized beds and associated equipment shall be of identified types. The high-voltage circuits shall be designed such that any discharge produced when the charging electrodes of the bed are approached or contacted by a grounded object shall not be of sufficient intensity to ignite any powder–air mixture likely to be encountered or to result in an appreciable shock hazard.

(a) Transformers, power packs, control apparatus, and all other electrical portions of the equipment shall be located outside the powder-coating area or shall otherwise comply with the requirements of 516.10(C)(1).

Exception: The charging electrodes and their connections to the power supply shall be permitted within the powder-coating area.

(b) All electrically conductive objects within the powder-coating area shall be adequately grounded. The powder-coating equipment shall carry a prominent, permanently installed warning regarding the necessity for grounding these objects.

Informational Note: For more information on grounding and bonding for static electricity purposes, see NFPA 33-2015, Standard for Spray Application Using Flammable or Combustible Materials; NFPA 34-2015, Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids; and NFPA 77-2007, Recommended Practice on Static Electricity.

(c) Objects being coated shall be maintained in electrical contact (less than 1 megohm) with the conveyor or other support in order to ensure proper grounding. Hangers shall be regularly cleaned to ensure effective electrical contact. Areas of electrical contact shall be sharp points or knife edges where possible.

(d) The electrical equipment and compressed air supplies shall be interlocked with a ventilation system so that the equipment cannot be operated unless the ventilating fans are in operation. [33: Chapter 15]

516.16 Grounding.

All metal raceways, the metal armors or metallic sheath on cables, and all non–current-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded and bonded. Grounding and bonding shall comply with 501.30, 502.30, or 505.25, as applicable.

Part IV Spray Application Operations in Membrane Enclosures.

516.18 Membrane Enclosure Use.

Spray application operations within both outdoor and indoor temporary membrane enclosures shall be limited to workpieces that cannot be moved into a spray booth and where open spraying is not practical due to the proximity to other operations, finish quality, or concerns such as the collection of overspray.

(1) Spray application operations and processes within the enclosure shall only be permitted for the workpiece for which the enclosure was erected.

(2) Spray application operations for parts removed from the workpiece shall be conducted in accordance with applicable requirements of this standard.

(3) Membrane enclosures shall be erected for 180 days or less.

(4) Enclosures erected under this chapter shall only be used for the duration of a spray operation at a fixed location which can involve multiple coats for a single workpiece.

(5) Membrane material shall not be reused for any other spray application operations.

(6) Operations conducted within the enclosure other than spray applications shall meet the fire and safety requirements for those operations.

(7) These operations shall not take place while the spray application operation is in progress.

Informational Note: For additional guidance, see Chapter 18 of NFPA 33-2015, Standard for Spray Application Using Flammable or Combustible Materials.
516.20. Location of Temporary Membrane Enclosures.
Temporary membrane enclosures shall be permitted to be located in accordance with 516.20(A) and 516.20(B).

(A). Outside of Buildings.
The spray area shall be separated from permanent structures by a minimum of 4.6 m (15 ft).

(B). Inside of Buildings.
Membrane enclosures for spray painting shall be permitted to be installed in buildings provided all of the requirements 516.21 are met.

Membrane materials shall comply with the following requirements:

1. Material used in a vertical plane for membrane enclosures shall have been tested and passed the NFPA 701-2015, Standard Methods of Fire Tests for Flame Propagation of Textiles and Films, Test 2 requirements.

2. Other than material in a vertical plane, the membrane material shall be listed for installation beneath sprinklers and installed to meet the requirements of 8.15.15 of NFPA 13-2014, Standard for the Installation of Sprinkler Systems.

3. Where a listed membrane material is used, it shall be considered a drop-out ceiling in NFPA 13-2014, Standard for the Installation of Sprinkler Systems, and follow the applicable requirements for those assemblies.

Informational Note: Buildings in which membrane enclosures are installed are provided with automatic sprinkler systems in accordance with the requirements for indoor membrane enclosures of NFPA 33-2015, Standard for Spray Application Using Flammable or Combustible Materials.

516.22. Area Classification for Temporary Membrane Enclosures.
The area classification shall be as given in 516.22(A)(1) through (A)(8) and is illustrated by Figure 516.22.
(A) Classification of Locations.

The zone system of electrical area classification shall be applied as follows:

1. A 1.5 m (5 ft) zone outside of the membrane enclosure shall be considered Class I, Division 2, as shown in Figure 516.22.

2. All lighting, electrical power cords, and any related equipment within the membrane enclosure shall be rated for Class I Division 1 as defined by NFPA 70 when used during spray paint operations.

3. All lighting, electrical power cords, and any related equipment within the 1.5 m (5 ft) distance horizontally from the exterior of the membrane enclosure shall be listed for Class I Division 2 as defined by NFPA 70 when used during spray paint operations.

4. All power to the workpiece shall be removed during spray painting.

5. Workpieces shall be grounded.

6. Scaffolding shall be bonded to the workpiece and grounded to an appropriate grounding rod or other approved method consistent with 6.2.1 referenced requirements.

7. Spray paint equipment shall be grounded.

8. Equipment used to monitor the concentration of solvent vapors shall be calibrated for the solvents used. The calibration frequency shall be per the manufacturer’s recommendations.

Figure 516.22 Electrical Classifications for Temporary Outdoor Membrane Enclosures [33:Figure 18.7.1.1]

516.23 Electrical and Other Sources of Ignition.

Electrical wiring and utilization equipment used in membrane enclosures during spray painting shall comply with 516.5(A)(1).
516.24. **Ventilation.**

Each membrane enclosure shall be provided with mechanical ventilation consistent with the following:

1. The ventilation system shall be designed and installed to ensure that the enclosure is maintained at a pressure that is negative relative to the surrounding environs.

2. The concentration of the vapors and mists in the exhaust stream of the ventilation system during spray operations and ambient air drying operations shall not exceed 10 percent of the lower flammable limit.

3. All spray operations within the membrane enclosure shall cease operations when the concentration of the vapors and mists in the exhaust stream of the ventilation system reaches or exceeds 10 percent of the lower flammable limit.

4. An interlock shall be provided so that the spray apparatus is automatically stopped if the ventilation system fails to maintain the concentration of the vapors and mists in the exhaust stream below 10 percent of the lower flammable limit.

5. Where interlocks cannot be effectively provided for ventilation equipment that uses plant air, large air storage tanks, or equipment that cannot be instantly shut off, an audible alarm upon loss of ventilation that will alert all spray paint operators shall be permitted with authority having jurisdiction approval.

6. Exhaust air shall be taken from one or more points within 300 mm (12 in.) of the floor of the enclosure.

7. An adequate supply of clean make-up air shall be provided per the requirements of NFPA 33-2015, *Standard for Spray Application Using Flammable or Combustible Materials*.

8. The location of both the exhaust and make-up air openings shall be arranged to provide air movement throughout the enclosure and across all portions of the floor to prevent accumulation of flammable vapors.

   Each membrane spray enclosure shall be provided with mechanical ventilation that is capable of confining and removing vapors and mists to a safe location and is capable of confining and controlling combustible residues, dusts, and deposits. The concentration of the vapors and mists in the exhaust stream of the ventilation system shall not exceed 25 percent of the lower flammable limit.

9. Air exhausted from the membrane enclosure shall not be recirculated.

   Air exhausted to the atmosphere from liquid spray operations shall be conducted by ducts directly to the outside of the building. Exhaust ducts shall follow the most direct route to the point of discharge but shall not penetrate a fire wall. The exhaust discharge shall be directed away from any fresh air intakes. The exhaust duct discharge point shall be at least 1830 mm (6 ft) from any exterior wall or roof. The exhaust duct shall not discharge in the direction of any combustible construction that is within 7625 mm (25 ft) of the exhaust duct discharge point, nor shall it discharge in the direction of any unprotected opening in any noncombustible or limited-combustible construction that is within 7625 mm (25 ft) of the exhaust duct discharge point.

516.25. **Drying.**

Membrane enclosures used for spray application of flammable or combustible materials shall not be used for drying, curing, or fusing operations at elevated temperature.

Freshly sprayed workpieces shall be dried only in spaces that are ventilated to prevent the concentration of vapors from exceeding 10 percent of the lower flammable limit.

516.26. **Facilities Compliance Permitting.**

Spray application within temporary membrane enclosures shall be permitted and approved.

Informational Note: Spray application within temporary membrane enclosures can occur only after the requirements of Chapter 18 of NFPA 33-2015, *Standard for Spray Application Using Flammable or Combustible Materials*, are met.

Part V. **Printing, Dipping, and Coating Processes**
516.29 . Classification of Locations.
Classification is based on quantities of flammable vapors, combustible mists, residues, dusts, or deposits that are present or might be present in quantities sufficient to produce ignitable or explosive mixtures with air. Electrical wiring and electrical utilization equipment located adjacent to open processes shall comply with the requirements as follows. Examples of these requirements are illustrated in Figure 516.29(a), Figure 516.29(b), Figure 516.29(c), and Figure 516.29(d).

1. Electrical wiring and electrical utilization equipment located in any sump, pit, or below grade channel that is within 7620 mm (25 ft) horizontally of a vapor source, as defined by this standard, shall be suitable for Class I, Division 1 or Class I, Zone 1 locations. If the sump, pit, or channel extends beyond 7620 mm (25 ft) of the vapor source, it shall be provided with a vapor stop, or it shall be classified as Class I, Division 1 or Class I, Zone 1 for its entire length. [34: 6.4.1]

2. Electrical wiring and electrical utilization equipment located within 1525 mm (5 ft) of a vapor source shall be suitable for Class I, Division 1 or Class I, Zone 1 locations. The space inside a dip tank, ink fountain, ink reservoir, or ink tank shall be classified as Class I, Division 1 or Class I, Zone 0, whichever is applicable.

3. Electrical wiring and electrical utilization equipment located within 915 mm (3 ft) of the Class I, Division 1 or Class I, Zone 1 location shall be suitable for Class I, Division 2 or Class I, Zone 2 locations, whichever is applicable.

4. The space 915 mm (3 ft) above the floor and extending 6100 mm (20 ft) horizontally in all directions from the Class I, Division 1 or Class I, Zone 1 location shall be classified as Class I, Division 2 or Class I, Zone 2, and electrical wiring and electrical utilization equipment located within this space shall be suitable for Class I, Division 2 or Class I, Zone 2 locations, whichever is applicable.

5. This space shall be permitted to be nonclassified for purposes of electrical installations if the surface area of the vapor source does not exceed 0.5 \( m^2 \) (5 ft\(^2\)), the contents of the dip tank, ink fountain, ink reservoir, or ink tank do not exceed 19 L (5 gal), and the vapor concentration during operating and shutdown periods does not exceed 25 percent of the lower flammable limit.

Figure 516.29(a) Electrical Area Classification for Open Dipping and Coating Processes Without Vapor Containment or Ventilation. [34: Figure 6.4(a)]

Figure 516.29(b) Electrical Area Classification for Open Dipping and Coating Processes with Peripheral Vapor Containment and Ventilation — Vapors Confined to Process Equipment. [34: Figure 6.4(b)]
Figure 516.29(c) Electrical Area Classification for Open Dipping and Coating Processes with Partial Peripheral Vapor Containment and Ventilation — Vapors NOT Confined to Process Equipment. [34:Figure 6.4(c)]

Figure 516.29(d) Electrical Area Classification for a Typical Printing Process. [34:Figure 6.4(d)]
**516.35. Areas Adjacent to Enclosed Dipping and Coating Processes.**

Areas adjacent to enclosed dipping and coating processes are illustrated by Figure 516.35 and shall be classified as follows:

1. The interior of any enclosed dipping or coating process or apparatus shall be a Class I, Division 1 or Class I, Zone 1 location, and electrical wiring and electrical utilization equipment located within this space shall be suitable for Class I, Division 1 or Class I, Zone 1 locations, whichever is applicable. The area inside the dip tank shall be classified as Class I, Division 1 or Class I, Zone 0, whichever is applicable.

2. The space within 915 mm (3 ft) in all directions from any opening in the enclosure and extending to the floor or grade level shall be classified as Class I, Division 2 or Class I, Zone 2, and electrical wiring and electrical utilization equipment located within this space shall be suitable for Class I, Division 2 locations or Class I, Zone 2 locations, whichever is applicable.

3. All other spaces adjacent to an enclosed dipping or coating process or apparatus shall be classified as nonhazardous for purposes of electrical installations.

**Figure 516.35 Electrical Area Classification Around Enclosed Dipping and Coating Processes. [34:Figure 6.5]**

---

**516.36. Equipment and Containers in Ventilated Areas.**

Open containers, supply containers, waste containers, and solvent distillation units that contain Class I liquids shall be located in areas ventilated in accordance with 516.4.

**516.37. Luminaires.**

For printing, coating and dipping equipment where the process area is enclosed by glass panels that are sealed to confine vapors and mists to the inside of the enclosure, luminaires that are attached to the walls or ceilings of a process enclosure and that are located outside of any classified area shall be permitted to be of general purpose construction. Such luminaires shall be serviced from outside the enclosure.

Luminaires that are attached to the walls or ceilings of a process enclosure, are located within the Class I, Division 2 or Class I, Zone 2 location, and are separated from the process area by glass panels that are sealed to confine vapors and mists shall be suitable for use in that location. Such fixtures shall be serviced from outside the enclosure.

**516.38. Wiring and Equipment Not Within Classified Locations.**
(A) Wiring

All fixed wiring above the Class I and II locations shall be in metal raceways, Type PVC conduit, Type RTRC conduit, or electrical nonmetallic tubing; where cables are used, they shall be Type MI, Type TC, or Type MC cable. Cellular metal floor raceways shall only be permitted to supply ceiling outlets or as extensions to the area below the floor of a Class I or II location. Where cellular metal raceways, are used, they shall not have connections leading into or passing through the Class I or II location unless suitable seals are provided.

(B) Equipment

Equipment that is capable of producing arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, motors, or other equipment having make-and-break or sliding contacts, where installed above a classified location or above a location where freshly finished goods are handled, shall be of the totally enclosed type or be constructed so as to prevent the escape of sparks or hot metal particles.

516.40 Static Electric Discharges

All persons and all electrically conductive objects, including any metal parts of the process equipment or apparatus, containers of material, exhaust ducts, and piping systems that convey flammable or combustible liquids, shall be electrically grounded.

Provision shall be made to dissipate static electric charges from all nonconductive substrates in printing processes.

Informational Note: For additional guidance on reducing the risk of ignition from electrostatic discharges, see NFPA 77-2014, Recommended Practice on Static Electricity.
Exposed Conductive Surfaces.
Those surfaces that are capable of carrying electric current and that are unprotected, unenclosed, or unguarded, permitting personal contact. Paint, anodizing, and similar coatings are not considered suitable insulation, unless they are listed for such use. [99:3.3.47]

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that the Panel clarify the location of the extracted section numbering because the second sentence of the defined term is not contained in the NFPA 99 definition. The Panel should revise the second sentence to comply with the NEC Style Manual with regard to mandatory text.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4214-NFPA 70-2015
Statement: The second sentence is removed from the requirement and relocated as an Informational Note, since this sentence is not mandatory text. “Uninsulated” was inadvertently omitted in the FD.

This action addresses the concerns of the CC.
Patient Care Space.

Any space of a health care facility wherein patients are intended to be examined or treated. [99:3.3.127]

Basic Care (Category 3) Space.

Space in which failure of equipment or a system is not likely to cause injury to the patients, staff, or visitors but can cause patient discomfort. [99:3.3.127.3]

General Care (Category 2) Space.

Space in which failure of equipment or a system is likely to cause minor injury to patients, staff, or visitors. [99:3.3.127.2]

Critical Care (Category 1) Space.

Space in which failure of equipment or a system is likely to cause major injury or death of patients, staff, or visitors. [99:3.3.127.1]

Support (Category 4) Space.

Space in which failure of equipment or a system is not likely to have a physical impact on patient care. [99:3.3.127.4]

Informational Note No. 1: The governing body of the facility designates patient care space in accordance with the type of patient care anticipated and with the definitions of the space classification. [99:1.3.4.1]

Informational Note No. 2: Business offices, corridors, lounges, day rooms, dining rooms, or similar areas typically are not classified as patient care space. [99:A.3.3.127]

Informational Note No. 3: Category 1 spaces, formerly known as critical care rooms (spaces), are typically where patients are intended to be subjected to invasive procedures and connected to line operated, patient care–related appliances. Examples include, but are not limited to, special care patient rooms used for critical care, intensive care, and special care treatment rooms such as angiography laboratories, cardiac catheterization laboratories, delivery rooms, operating rooms, post-anesthesia care units, trauma rooms, and other similar rooms. [99:A.3.3.127.1]

Informational Note No. 4: Category 2 spaces were formerly known as general care rooms (spaces). Examples include, but are not limited to, inpatient bedrooms, dialysis rooms, in vitro fertilization rooms, procedural rooms, and similar rooms. [99:A.3.3.127.2]

Informational Note No. 5: Category 3 spaces, formerly known as basic care rooms (spaces), are typically where basic medical or dental care, treatment, or examinations are performed. Examples include, but are not limited to, examination or treatment rooms in clinics, medical and dental offices, nursing homes, and limited care facilities. [99:A.3.3.127.3]

Informational Note No. 6: Category 4 spaces were formerly known as support rooms (spaces). Examples of support spaces include, but are not limited to, anesthesia work rooms, sterile supply, laboratories, morgues, waiting rooms, utility rooms, and lounges. [99:A.3.3.127.4]

Statement of Problem and Substantiation for Public Comment

Aside from the editorial correction of "ofa" to "of a", this Public Comment is responsive to NEC® Correlating Committee Note CN155 regarding 2017 NEC® First Revision FR4247 for Article 517 [and First Revision FR347 for Section 210.8(B)].

In accordance with 4.3.3 of the National Electrical Code® Style Manual and 2.3.2.11 of the Manual of Style for NFPA Technical Committee Documents regarding extracted materials, NFPA 99 Fundamentals Technical Committee, as the committee responsible for the source document, HAS CONSENTED to use parenthetic references between specific older and current NFPA 99 terminology during a transition to current NFPA 99 terminology in the National Electrical Code®.

Committee Statement

- **Committee Action:** Rejected but see related SR
- **Resolution:** SR-4215-NFPA 70-2015
- **Statement:**

  Responsive to Correlating Committee (Public Comment PC 1813), in accordance with 4.3.3 of the National Electrical Code® Style Manual and 2.3.2.11 of the Manual of Style for NFPA Technical Committee Documents regarding extracted materials, the consent of the NFPA 99 Fundamentals Technical Committee, as the committee responsible for the source document, was sought and obtained to use parenthetic references between specific older and current NFPA 99 terminology during a transition to current NFPA 99 terminology in the National Electrical Code®. [Ref. Minutes of NFPA Technical Committee on Fundamentals (HEA-FUN), August 13, 2015, Item 7] This written permission is documented in the attachments submitted with Public Comment PC 1175.

  Accordingly, the 2017 NEC® will use the transitional terminology, as follows: “Critical Care Space (Category 1 Space)”, “General Care Space (Category 2 Space)”, “Basic Care Space (Category 3 Space)”, and “Support Space (Category 4 Space)”.

  CMP-15 intends to modify the 2020 NEC® to use the transitional terminology, as follows: “Category 1 Space (Critical Care Space)”, “Category 2 Space (General Care Space)”, “Category 3 Space (Basic Care Space)”, and “Category 4 Space (Support Space)”.

  CMP-15 intends to modify the 2023 NEC® to use NFPA 99’s terminology directly, as follows: “Category 1 Space”, “Category 2 Space”, “Category 3 Space”, and “Category 4 Space”.

  Relocation of the informational notes, in accordance with Public Comment PC 470, improves readability by immediately following the requirement to which each informational note applies. Although NEC® Style Manual 2.6.1 applies solely to Exceptions, Code-Making Panel 15 recommends to the Correlating Committee that similar guidelines be added to NEC® Style Manual (2.4.3) for Informational Notes as well.
Public Comment No. 1467-NFPA 70-2015 [Definition: Patient Care Space.]

**Patient, Category 1 Care Space.**
Any space of a health care facility wherein patients are intended to be examined or treated. [99:3.3.127]

**Basic, Care Space.**
Space in which failure of equipment or a system is not likely to cause injury to the patients, staff, or visitors but can cause patient discomfort. [99:3.3.127.3]

**General, Care Space.**
Space in which failure of equipment or a system is likely to cause minor injury to patients, staff, or visitors. [99:3.3.127.2]

**Critical, Care (Category 1), Category 1 Care Space.**
Space in which failure of equipment or a system is likely to cause major injury or death of patients, staff, or visitors. [99:3.3.127.1]

**Support, Support Space.**
Space in which failure of equipment or a system is not likely to have a physical impact on patient care. [99:3.3.127.4]

Informational Note No. 1: The governing body of the facility designates patient care space in accordance with the type of patient care anticipated and with the definitions of the space classification. [99:1.3.4.1]

Informational Note No. 2: Business offices, corridors, lounges, day rooms, dining rooms, or similar areas typically are not classified as patient care space. [99:A.3.3.127]

Informational Note No.3: Category 1 spaces, formerly known as critical care rooms (spaces), are typically where patients are intended to be subjected to invasive procedures and connected to line operated, patient care–related appliances. Examples include, but are not limited to, special care patient rooms used for critical care, intensive care, and special care treatment rooms such as angiography laboratories, cardiac catheterization laboratories, delivery rooms, operating rooms, post-anesthesia care units, trauma rooms, and other similar rooms. [99:A.3.3.127.1]

Informational Note No. 4: Category 2 spaces were formerly known as general care rooms (spaces). Examples include, but are not limited to, inpatient bedrooms, dialysis rooms, in vitro fertilization rooms, procedural rooms, and similar rooms. [99:A.3.3.127.2]

Informational Note No. 5: Category 3 spaces, formerly known as basic care rooms (spaces), are typically where basic medical or dental care, treatment, or examinations are performed. Examples include, but are not limited to, examination or treatment rooms in clinics, medical and dental offices, nursing homes, and limited care facilities. [99:A.3.3.127.3]

Informational Note No. 6: Category 4 spaces were formerly known as support rooms (spaces). Examples of support spaces include, but are not limited to, anesthesia work rooms, sterile supply, laboratories, morgues, waiting rooms, utility rooms, and lounges. [99:A.3.3.127.4]

**Statement of Problem and Substantiation for Public Comment**
The terms "Critical, patient, basic, general" are not in the referenced text in 99. including this term would be confusing to the user. NFPA 99 has specifically moved away from using those terms because they do not adequately describe the space needed.

Committee Statement

Committee Action: Rejected

Resolution: In accordance with 4.3.3 of the National Electrical Code® Style Manual and 2.3.2.11 of the Manual of Style for NFPA Technical Committee Documents regarding extracted materials, the consent of the NFPA 99 Fundamentals Technical Committee, as the committee responsible for the source document, was sought and obtained to use parenthetic references between specific older and current NFPA 99 terminology during a transition to current NFPA 99 terminology in the National Electrical Code®. [Ref. Minutes of NFPA Technical Committee on Fundamentals (HEA-FUN), August 13, 2015, Item 7] This written permission is documented in the attachments submitted with Public Comment PC 1175. See the Second Revision created to 517.2 (Patient Care Space).
Public Comment No. 1813-NFPA 70-2015 [Definition: Patient Care Space.]

Patient Care Space.
Any space ofa health care facility wherein patients are intended to be examined or treated. [99:3.3.127]

Basic Care (Category 3) Space.
Space in which failure of equipment or a system is not likely to cause injury to the patients, staff, or visitors but can cause patient discomfort. [99:3.3.127.3]

General Care (Category 2) Space.
Space in which failure of equipment or a system is likely to cause minor injury to patients, staff, or visitors. [99:3.3.127.2]

Critical Care (Category 1) Space.
Space in which failure of equipment or a system is likely to cause major injury or death of patients, staff, or visitors. [99:3.3.127.1]

Support (Category 4) Space.
Space in which failure of equipment or a system is not likely to have a physical impact on patient care. [99:3.3.127.4]

Informational Note No. 1: The governing body of the facility designates patient care space in accordance with the type of patient care anticipated and with the definitions of the space classification. [99:1.3.4.1]

Informational Note No. 2: Business offices, corridors, lounges, day rooms, dining rooms, or similar areas typically are not classified as patient care space. [99:A.3.3.127]

Informational Note No.3: Category 1 spaces, formerly known as critical care rooms (spaces), are typically where patients are intended to be subjected to invasive procedures and connected to line operated, patient care–related appliances. Examples include, but are not limited to, special care patient rooms used for critical care, intensive care, and special care treatment rooms such as angiography laboratories, cardiac catheterization laboratories, delivery rooms, operating rooms, post-anesthesia care units, trauma rooms, and other similar rooms. [99:A.3.3.127.1]

Informational Note No. 4: Category 2 spaces were formerly known as general care rooms (spaces). Examples include, but are not limited to, inpatient bedrooms, dialysis rooms, in vitro fertilization rooms, procedural rooms, and similar rooms. [99:A.3.3.127.2]

Informational Note No. 5: Category 3 spaces, formerly known as basic care rooms (spaces), are typically where basic medical or dental care, treatment, or examinations are performed. Examples include, but are not limited to, examination or treatment rooms in clinics, medical and dental offices, nursing homes, and limited care facilities. [99:A.3.3.127.3]

Informational Note No. 6: Category 4 spaces were formerly known as support rooms (spaces). Examples of support spaces include, but are not limited to, anesthesia work rooms, sterile supply, laboratories, morgues, waiting rooms, utility rooms, and lounges. [99:A.3.3.127.4]

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs Code-Making Panel 15 to give further consideration to the comments expressed in voting on FR 4247. Extracted material must comply with 4.3.2.2 of NEC Style Manual. This action will be considered as a public comment. The preferred method for parenthetical text is to have the new term first with the old term in parenthesis.

Grounding of Receptacles and Fixed Electrical Equipment in Patient Care Spaces.

Wiring in patient care spaces shall comply with 517.13(A) and (B).

(A) Wiring Methods.

All branch circuits serving patient care areas, spaces, shall be provided with an effective ground-fault current path by installation in a metal raceway system, or a cable having a metallic armor or sheath assembly. The metal raceway system, or metallic cable armor, or sheath assembly shall itself qualify as an equipment grounding conductor in accordance with 250.118.

(B) Insulated Equipment Grounding Conductors and Insulated Equipment Bonding Jumpers.

(1) General.

The following shall be directly connected to an insulated copper equipment grounding conductor that is green, clearly identified along its entire length by green insulation, and installed with the branch circuit conductors in the wiring methods as provided in 517.13(A):

(1) The grounding terminals of all receptacles other than isolated ground receptacles

(2) Where receptacles are mounted in metal receptacle outlet boxes, metal device boxes, or metal enclosures, the performance of the connection between the receptacle grounding terminal and the metal box or enclosure shall be equivalent to the performance provided by copper wire sized in accordance with 250.146 and Table 250.122 but no smaller than 12 AWG. [99: 6.3.2.2.2.4]

(3) All non-current-carrying conductive surfaces of fixed electrical equipment likely to become energized that are subject to personal contact, operating at over 100 volts

Exception No. 1: For other than isolated ground receptacles, an insulated equipment bonding jumper that directly connects to the equipment grounding conductor is permitted to connect the box and receptacle(s) to the equipment grounding conductor. Isolated ground receptacles shall be connected in accordance with 517.16.

Exception No. 2: Metal faceplates shall be permitted to be connected to the equipment grounding conductor by means of a metal mounting screw(s) securing the faceplate to a grounded outlet box or grounded wiring device.

Exception No. 3: Luminaires more than 2.3 m (7 1/2 ft) above the floor and switches located outside of the patient care vicinity shall be permitted to be connected to an equipment grounding return path complying with 517.13(A) and (B).

(2) Sizing.

Equipment grounding conductors and equipment bonding jumpers shall be sized in accordance with 250.122.

Statement of Problem and Substantiation for Public Comment

The revision to 517.13(B)(1)(1) to exclude isolated ground receptacles is essential to correlate with 517.16(B) as modified by FR4260 and to avoid defeating the isolated grounding of an IG receptacle by miswiring per the 517.16 reference to 517.13(B).

The term "metal receptacle boxes" in revised 517.16(B)(1)(2) is inconsistent with the term "metal outlet boxes" or "metal device boxes" used in the National Electrical Code® NFPA 70 (e.g., "Article 314 Outlet, Device, Pull, and Junction Boxes ...") and the Safety Standard UL 514A under which such metal outlet boxes (for receptacles) are evaluated. In NEC® 517.13(B)(1)(2), a Public Input to use extracted wording from NFPA 99-2015 6.3.2.2.2.4 introduces inconsistency that degrades needlessly the readability of the NEC®.

Furthermore, receptacles are not only flush- or surface-mounted in metal outlet boxes or metal device boxes, but can be panel-mounted in metal enclosures that present the same safety concerns. NEC® 517.13(B)(1) EXPLICITLY recognizes receptacles mounted in metal enclosures and imposes the same grounding requirements as for outlet and device boxes. A Public Input has also been submitted to correct NFPA 99-2018, 6.3.2.2.2.4, identically.

As 517.13(B)(1)(2) was revised in FR4261, it is ambiguous whether 517.13(B)(1)(2) permits equipment bonding jumpers to be sized as copper 12 AWG for 60A, 100A, and 200A receptacles rather than to be unequivocally equivalent to copper 10 AWG, 8 AWG, or 6 AWG, respectively, in accordance with the minimum sizes of NEC® 250.146 and Table 250.122.

Since 517.16(B) encompasses equipment bonding jumpers in addition to equipment grounding conductors, equipment bonding jumpers should be reflected in the subsection title. Because sizing of the equipment bonding jumper is addressed in revised 517.16(B)(1), sizing of equipment bonding jumpers should not be reflected redundantly in 517.16(B)(2). As presently revised, there is a correlation issue because the two requirements conflict for 15 A receptacles.

The grounding conductor’s insulation, not the copper conductor itself, should be green.

Editorial: Use term “patient care spaces” in place of “patient care areas” for consistency throughout NEC® Article 517 and with NFPA 99.
First Revision No. 4261-NFPA 70-2015 [Section No. 517.13]

Submitter Information Verification

Submitter Full Name: BRIAN ROCK
Organization: HUBBELL INCORPORATED
Street Address:
City:
State:
Zip:
Submittal Date: Thu Jun 25 15:47:44 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4216-NFPA 70-2015
Statement: The revision to 517.13(B)(1)(1) to exclude isolated ground receptacles is essential to correlate with 517.16(B) as modified by FR4260 and to avoid defeating the isolated grounding feature of an IG receptacle by miswiring per the 517.16 reference to 517.13(B).

The title of 517.16(B) is revised since requirements encompasses equipment bonding jumpers in addition to equipment grounding conductors.

The NFPA 99-extracted requirements has been relocated from 517.16(B)(1)(2) to the Sizing requirement in 517.16(B)(2).

The connection point requirement in revised 517.16(B)(1)(2) is no longer that sizing requirement but clarifies the distinct connection point portion of the requirement. Consequently, the term “metal receptacle boxes” in revised 517.16(B)(1)(2) is revised to be consistent with the term “metal outlet boxes” or “metal device boxes” used in the National Electrical Code® NFPA 70 (e.g., “Article 314 Outlet, Device, Pull, and Junction Boxes ...”).

As 517.13(B)(1)(2) was revised in FR4261 and in accordance with 90.3, it was ambiguous whether 517.13(B)(1)(2) might permit equipment bonding jumpers to be sized as copper 12 AWG for 60A, 100A, and 200A receptacles rather than to be unequivocally equivalent to copper 10 AWG, 8 AWG, or 6 AWG, respectively, in accordance with the minimum sizes of 250.122. The requirement is modified for clarity and usability.

The grounding conductor’s insulation, not the copper conductor itself, should be green.

Exception No.3 is modified to clarify that either 517.13(A) or (B) may be used; it is not required to do both.

Editorial: Use term “patient care spaces” in place of “patient care areas” for consistency throughout NEC® Article 517 and with NFPA 99.
Public Comment No. 847-NFPA 70-2015 [Section No. 517.13]

517.13 Grounding of Receptacles and Fixed Electrical Equipment in Patient Care Spaces.

Wiring in patient care spaces shall comply with 517.13(A) and (B).

(A) Wiring Methods.

All branch circuits serving patient care areas shall be provided with an effective ground-fault current path by installation in a metal raceway system, or a cable having a metallic armor or sheath assembly. The metal raceway system, or metallic cable armor, or sheath assembly shall itself qualify as an equipment grounding conductor in accordance with 250.118.

(B) Insulated Equipment Grounding Conductor and Insulated Equipment Bonding Jumper.

(1) General.

The following shall be directly connected to an insulated copper equipment grounding conductor that is clearly identified using green insulation along its entire length and installed with the branch circuit conductors in the wiring methods as provided in 517.13(A):

(1) The grounding terminals of all receptacles

Where metal receptacle boxes are used,

(2) other than isolated ground receptacles

(3) Where receptacles are mounted in metal outlet boxes, metal device boxes, or metal enclosures, the performance of the connection between the receptacle grounding terminal and the metal box or enclosure shall be equivalent to the performance provided by copper wire sized in accordance with 250.146 and Table 250.122 but no smaller than 12 AWG.

(4) All non–current-carrying conductive surfaces of fixed electrical equipment likely to become energized that are subject to personal contact, operating at over 100 volts

Exception No. 1: An insulated equipment bonding jumper that directly connects to the equipment grounding conductor is permitted to connect the box and receptacle(s) to the equipment grounding conductor.

Exception No. 2: Metal faceplates shall be permitted to be connected to the equipment grounding conductor by means of a metal mounting screw(s) securing the faceplate to a grounded outlet box or grounded wiring device.

Exception No. 3: Luminaires more than 2.3 m (7 1/2 ft) above the floor and switches located outside of the patient care vicinity shall be permitted to be connected to an equipment grounding return path complying with 517.13(A) and (B).

(2) Sizing.

Equipment grounding conductors and equipment bonding jumpers shall be sized in accordance with 250.122.

Statement of Problem and Substantiation for Public Comment

The revision to 517.13(B)(1)(1) to exclude isolated ground receptacles is essential to correlate with 517.16(B) as modified by FR4260 and to avoid defeating the isolated grounding of an IG receptacle by miswiring per 517.16 reference to 517.13(B).

The term "metal receptacle boxes" in revised 517.16(B)(1) (2) is inconsistent with the term "metal outlet boxes" or "metal device boxes" used in the National Electrical Code® NFPA 70 (e.g., "Article 314 Outlet, Device, Pull, and Junction Boxes ...") and the Safety Standard UL 514A under which such metal outlet boxes (for receptacles) are evaluated. In NEC® 517.13(B)(1)(2), a Public Input to use extracted wording from NFPA 99-2015 6.3.2.2.2.4 introduces inconsistency that degrades needlessly the readability of the NEC®.

Furthermore, receptacles are not only flush- or-surface-mounted in metal outlet boxes or metal device boxes, but can be panel-mounted in metal enclosures that present the same safety concerns. NEC® 517.13(B)(1) EXPLICITLY recognizes receptacles mounted in metal enclosures and imposes the same grounding requirements as for outlet and device boxes. NFPA 99 needs to be similarly revised.

As 517.13(B)(1)(2) was revised in FR4261, it is ambiguous whether 517.13(B)(1)(2) permits equipment bonding jumpers to be sized as copper 12 AWG for 60A, 100A, and 200A receptacles rather than to be unequivocally equivalent to copper 10 AWG, 8 AWG, or 6 AWG, respectively, in accordance with the minimum sizes of NEC® 250.146 and Table 250.122.

Since 517.16(B) encompasses equipment bonding jumpers in addition to equipment grounding conductors, equipment bonding jumpers should be reflected in the subsection title. Because sizing of the equipment bonding jumper is addressed in revised 517.16(B)(1), sizing of equipment bonding jumpers should not be reflected redundantly in 517.16(B)(2). As presently revised, the two requirements conflict for 15 A receptacles.

The grounding conductor’s insulation, not the copper conductor itself, should be green.

Resolution: SR-4216-NFPA 70-2015

Statement: The revision to 517.13(B)(1)(1) to exclude isolated ground receptacles is essential to correlate with 517.16(B) as modified by FR4260 and to avoid defeating the isolated grounding feature of an IG receptacle by miswiring per the 517.16 reference to 517.13(B).

The title of 517.16(B) is revised since requirements encompasses equipment bonding jumpers in addition to equipment grounding conductors.

The NFPA 99-extracted requirements has been relocated from 517.16(B)(1)(2) to the Sizing requirement in 517.16(B)(2).

The connection point requirement in revised 517.16(B)(1)(2) is no longer that sizing requirement but clarifies the distinct connection point portion of the requirement. Consequently, the term "metal receptacle boxes" in revised 517.16(B)(1)(2) is revised to be consistent with the term "metal outlet boxes" or "metal device boxes" used in the National Electrical Code® NFPA 70 (e.g., "Article 314 Outlet, Device, Pull, and Junction Boxes ...”).

As 517.13(B)(1)(2) was revised in FR4261 and in accordance with 90.3, it was ambiguous whether 517.13(B)(1)(2) might permit equipment bonding jumpers to be sized as copper 12 AWG for 60A, 100A, and 200A receptacles rather than to be unequivocally equivalent to copper 10 AWG, 8 AWG, or 6 AWG, respectively, in accordance with the minimum sizes of 250.122. The requirement is modified for clarity and usability.

The grounding conductor’s insulation, not the copper conductor itself, should be green.

Exception No.3 is modified to clarify that either 517.13(A) or (B) may be used; it is not required to do both.

Editorial: Use term “patient care spaces” in place of “patient care areas” for consistency throughout NEC® Article 517 and with NFPA 99.
Public Comment No. 1656-NFPA 70-2015 [ Section No. 517.13(B)(1) ]

(1) General.

The following shall be directly connected to an insulated copper equipment grounding conductor that is green along its entire length and installed with the branch circuit conductors in the wiring methods as provided in 517.13(A):

(1) The grounding terminals of all receptacles

(2) Where metal receptacle boxes are used, the performance of the connection between the receptacle grounding terminal and the metal box shall be equivalent to the performance provided by copper wire no smaller than 12 AWG.

Metal boxes and enclosures containing receptacles

(3) All non–current-carrying conductive surfaces of fixed electrical equipment likely to become energized that are subject to personal contact, operating at over 100 volts

Exception No. 1: An insulated equipment bonding jumper that directly connects to the equipment grounding conductor is permitted to connect the box and receptacle(s) to the equipment grounding conductor.

Exception No. 2: Metal faceplates shall be permitted to be connected to the equipment grounding conductor by means of a metal mounting screw(s) securing the faceplate to a grounded outlet box or grounded wiring device.

Exception No. 3: Luminaires more than 2.3 m (7 1/2 ft) above the floor and switches located outside of the patient care vicinity shall be permitted to be connected to an equipment grounding return path complying with 517.13(A), and or (B).

Statement of Problem and Substantiation for Public Comment

Item two is revised to create a coherent statement.

Exception two is revised to allow either (A) or (B) to be used, which is what the original proposal sought. As written by the panel, the exception isn’t excepting anything out, as it just states that I must comply with (A) AND (B), instead of (A) OR (B).

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4216-NFPA 70-2015
Statement: The revision to 517.13(B)(1)(1) to exclude isolated ground receptacles is essential to correlate with 517.16(B) as modified by FR4260 and to avoid defeating the isolated grounding feature of an IG receptacle by miswiring per the 517.16 reference to 517.13(B).

The title of 517.16(B) is revised since requirements encompasses equipment bonding jumpers in addition to equipment grounding conductors.

The NFPA 99-extracted requirements has been relocated from 517.16(B)(1)(2) to the Sizing requirement in 517.16(B)(2).

The connection point requirement in revised 517.16(B)(1)(2) is no longer that sizing requirement but clarifies the distinct connection point portion of the requirement. Consequently, the term "metal receptacle boxes" in revised 517.16(B)(1)(2) is revised to be consistent with the term "metal outlet boxes" or "metal device boxes" used in the National Electrical Code® NFPA 70 (e.g., "Article 514 Outlet, Device, Pull, and Junction Boxes ...").

As 517.13(B)(1)(2) was revised in FR4261 and in accordance with 90.3, it was ambiguous whether 517.13(B)(1)(2) might permit equipment bonding jumpers to be sized as copper 12 AWG for 60A, 100A, and 200A receptacles rather than to be unequivocally equivalent to copper 10 AWG, 8 AWG, or 6 AWG, respectively, in accordance with the minimum sizes of...
250.122. The requirement is modified for clarity and usability.

The grounding conductor’s insulation, not the copper conductor itself, should be green.

Exception No.3 is modified to clarify that either 517.13(A) or (B) may be used; it is not required to do both.

Editorial: Use term “patient care spaces” in place of “patient care areas” for consistency throughout NEC® Article 517 and with NFPA 99.
1) General.

The following shall be directly connected to an insulated copper equipment grounding conductor that is green along its entire length and installed with the branch circuit conductors in the wiring methods as provided in 517.13(A):

1) The grounding terminals of all receptacles

2) Where metal receptacle boxes are used, metal boxes and enclosures containing receptacles, unless the performance of the connection between the receptacle grounding terminal and the metal box shall be equivalent, is equivalent to the performance provided by copper wire no smaller than 12 AWG. [99:6.3.2.2.2.4]

3) All non-current-carrying conductive surfaces of fixed electrical equipment likely to become energized that are subject to personal contact, operating at over 100 volts

Exception No. 1: An insulated equipment bonding jumper that directly connects to the equipment grounding conductor is permitted to connect the box and receptacle(s) to the equipment grounding conductor.

Exception No. 2: Metal faceplates shall be permitted to be connected to the equipment grounding conductor by means of a metal mounting screw(s) securing the faceplate to a grounded outlet box or grounded wiring device.

Exception No. 3: Luminaires more than 2.3 m (7 1/2 ft) above the floor and switches located outside of the patient care vicinity shall be permitted to be connected to an equipment grounding return path complying with 517.13(A), and or (B).

Statement of Problem and Substantiation for Public Comment

In 517.13 (B)(1), the three items listed below 517.13 (B)(1) are list items that should follow, the qualifier of the list "The following shall be directly connected.....". As written, (2) does not make sense as a list item. The language used in this proposed revision continues a consistent list. An alternative could be to keep the original 517.13 (B)(1)(2) list item, as written in the 2014 edition, and include an exception as follows: Exception to (2): Metal boxes or enclosures that contains receptacles shall not be required to be directly connected to an insulated equipment ground conductor if the performance of the connection between the receptacle grounding terminal and the metal box or enclosure is equivalent to the performance provided by a copper wire no smaller than #12 AWG.

In 517.13 (B) Exception No. 3: If the exception was intended to require one method of grounding, vs. both, then the exception should be "517.13 (A) OR (B)"

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4216-NFPA 70-2015
Statement: The revision to 517.13(B)(1)(1) to exclude isolated ground receptacles is essential to correlate with 517.16(B) as modified by FR4260 and to avoid defeating the isolated grounding feature of an IG receptacle by miswiring per the 517.16 reference to 517.13(B).

The title of 517.16(B) is revised since requirements encompasses equipment bonding jumpers in addition to equipment grounding conductors.

The NFPA 99-extracted requirements has been relocated from 517.16(B)(1)(2) to the Sizing requirement in 517.16(B)(2).

The connection point requirement in revised 517.16(B)(1)(2) is no longer that sizing requirement but clarifies the distinct connection point portion of the requirement. Consequently, the term "metal receptacle boxes" in revised 517.16(B)(1)(2)
is revised to be consistent with the term "metal outlet boxes" or "metal device boxes" used in the National Electrical Code® NFPA 70 (e.g., "Article 314 Outlet, Device, Pull, and Junction Boxes ...").

As 517.13(B)(1)(2) was revised in FR4261 and in accordance with 90.3, it was ambiguous whether 517.13(B)(1)(2) might permit equipment bonding jumpers to be sized as copper 12 AWG for 60A, 100A, and 200A receptacles rather than to be unequivocally equivalent to copper 10 AWG, 8 AWG, or 6 AWG, respectively, in accordance with the minimum sizes of 250.122. The requirement is modified for clarity and usability.

The grounding conductor’s insulation, not the copper conductor itself, should be green.

Exception No.3 is modified to clarify that either 517.13(A) or (B) may be used; it is not required to do both.

Editorial: Use term “patient care spaces” in place of “patient care areas” for consistency throughout NEC® Article 517 and with NFPA 99.
## Public Comment No. 1471-NFPA 70-2015 [Section No. 517.16]

517.16 Use of Isolated *Grounding* Receptacles.

(A) An isolated grounding receptacle shall not be installed within a patient care vicinity. [99:6.3.2.2.7.1(B)]

(B) Isolated grounding receptacle(s) used outside of a patient care vicinity shall not defeat the purposes of the safety features of the grounding systems detailed in 517.13.

(1) Isolated grounding receptacles installed in branch circuits for patient care spaces shall be connected to an insulated equipment grounding conductor in accordance with 250.146(D) in addition to the two equipment grounding conductor paths required in 517.13(A) and (B).

(2) The equipment grounding conductor installed for isolated grounding receptacles in patient care areas shall be clearly identified using green insulation with one or more yellow stripes along its entire length.

Informational Note No. 1: This type of installation is typically used where a reduction of electrical noise (electromagnetic interference) is necessary, and parallel grounding paths are to be avoided.

Informational Note No. 2: Care should be taken in specifying a system containing isolated ground receptacles, because the grounding impedance is controlled only by the grounding wires and does not benefit from any conduit or building structure in parallel with the grounding path. [99:A.6.3.2.2.7.1]

### Statement of Problem and Substantiation for Public Comment

The word *Grounding* is used in the body of the text (Not Grounded)

National Fire Protection Association Report http://submittals.nfpa.org/TerraViewWeb/ContentFetcher?commentPara...
517.16 Use of Isolated Ground Receptacles.

(A) An isolated grounding receptacle shall not be installed within a patient care vicinity. [99:6.3.2.2.7.1(B)]

(B) Isolated grounding receptacle(s) used outside of a patient care vicinity shall not defeat the purposes of the safety features of the grounding systems detailed in 517.13.

(1) Isolated grounding receptacles installed in branch circuits for patient care spaces shall be connected to an insulated equipment grounding conductor in accordance with 250.146(D) in addition to the two equipment grounding conductor paths required in 517.13(A) and (B).

(2) The equipment grounding conductor installed for isolated grounding receptacles in patient care areas shall be clearly identified using green insulation with one or more yellow stripes along its entire length.

Informational Note No. 1: This type of installation is typically used where a reduction of electrical noise (electromagnetic interference) is necessary, and parallel grounding paths are to be avoided. [99:A.6.3.2.2.7.1]

Informational Note No. 2: Care should be taken in specifying a system containing isolated ground receptacles, because the grounding impedance is controlled only by the grounding wires and does not benefit from any conduit or building structure in parallel with the grounding path.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that further consideration be given to the comments expressed in voting on FR 4260 and to correlate with the use of the term “isolated ground receptacle” in 250.146 and 406.3(D).

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4217-NFPA 70-2015
Statement: This revision provides necessary clarity to First Revision No. 4260-NFPA 70-2015 (Section No. 517.6) and correlates with 517.13.

CMP-15 has clarified that the equipment grounding conductor path referenced in 517.13(B)(1) [green unstriped insulated conductor] shall not be incorrectly terminated to the Isolated Ground receptacle’s grounding terminal. This connection is to be made to the metal box or enclosure to which the Isolated Ground receptacle’s mounting means connects to the strap of the receptacle and bonds the faceplate.

517.16(B)(2) mandates “both” an insulated grounding conductor identified green with yellow stripes that is to be connected to the grounding terminal of the isolated ground receptacle “and” an insulated grounding conductor identified as green (without yellow striping) per NEC® 517.13(B)(1)(1) methods be used for this installation. If the isolated ground conductor is connected to the metal box and the isolated ground terminal, such a connection would negate the isolated grounding of an Isolated Ground receptacle established by NEC® 250.146(D).
Editorial changes include:

Use the term “isolated ground receptacles” for consistency throughout NEC® 517.16 and with NEC® 250.146(D) as directed by the Correlating Committee.

Further, the term “patient care areas” in NEC® 517.16(B)(2) should be consistent with “patient care spaces” now used in Article 517.
(B) Isolated ground receptacle(s) used installed in patient care spaces outside of a patient care vicinity shall not defeat the purposes of the safety features of the grounding systems detailed in 517.13 vicinities shall comply with 517.16(B)(1) and (2).

1. The grounding terminals of isolated ground receptacles installed in branch circuits for patient care spaces shall be connected to an insulated equipment grounding conductor in accordance with 250.146(D) in addition to the two equipment grounding paths required in 517.13(A) and (B).

2. The insulated grounding conductor required in 517.13(B)(1) shall be clearly identified along its entire length by green insulation, with no yellow stripes, and shall not be connected to the grounding terminals of isolated ground receptacles but shall be connected to the box or enclosure indicated in 517.13(B)(1)(2) and to non-current-carrying conductive surfaces of fixed electrical equipment indicated in 517.13(B)(1)(3).

Informational Note No. 1: This type of installation is typically used where a reduction of electrical noise (electromagnetic interference) is necessary, and parallel grounding paths are to be avoided.

Informational Note No. 2: Care should be taken in specifying a system containing isolated ground receptacles, because the grounding impedance is controlled only by the grounding wires and does not benefit from any conduit or building structure in parallel with the grounding path. [99:A.6.3.2.2.7.1]

Statement of Problem and Substantiation for Public Comment

As specified by FR4260, NEC® 517.16(B) is incorrectly correlated with NEC® 517.13(B)(1) as revised by FR4261. The equipment grounding conductor path referenced to NEC® 517.13(B)(1) [green unstriped insulated conductor] of FR4261 is incorrectly terminated to the IG receptacle’s grounding terminal instead of via the metal box or enclosure to the IG receptacle’s mounting means that bonds the faceplate. NEC® 517.16(B)(2) mandates BOTH an insulated grounding conductor identified green with yellow stripes AND an insulated grounding conductor identified as green (without yellow striping) per NEC® 517.13(B)(1)(1) be connected to the isolated ground receptacle's GROUNDING TERMINAL. Such a connection would negate the isolated grounding of an IG receptacle established by NEC® 250.146(D).

Editorial: Use the term "isolated ground receptacles" for consistency throughout NEC® 517.16 and with NEC® 250.146(D) in accordance with Correlating Committee Note 156. Further, the term "patient care areas" in NEC® 517.16(B)(2) should be consistent with "patient care spaces" now used in Article 517.

</tr>
</tbody>
</table>

CMP-15 has clarified that the equipment grounding conductor path referenced in 517.13(B)(1) [green unstriped insulated conductor] shall not be incorrectly terminated to the Isolated Ground receptacle’s grounding terminal. This connection is to be made to the metal box or enclosure to which the Isolated Ground receptacle’s mounting means connects to the strap of the receptacle and bonds the faceplate.

517.16(B)(2) mandates “both” an insulated grounding conductor identified green with yellow stripes that is to be connected to the grounding terminal of the isolated ground receptacle “and” an insulated grounding conductor identified as green (without yellow striping) per NEC® 517.13(B)(1)(1) methods be used for this installation. If the isolated ground conductor is connected to the metal box and the isolated ground terminal, such a connection would negate the isolated grounding of an Isolated Ground receptacle established by NEC® 250.146(D).

Editorial changes include:

Use the term “isolated ground receptacles” for consistency throughout NEC® 517.16 and with NEC® 250.146(D) as directed by the Correlating Committee.

Further, the term “patient care areas” in NEC® 517.16(B)(2) should be consistent with “patient care spaces” now used in Article 517.
(B) Isolated grounding receptacle(s) installed outside of a patient care vicinity shall not defeat the purposes of the safety features of the grounding systems detailed in 517.13.

(1) Isolated grounding terminals of isolated grounding receptacles installed in branch circuits for patient care spaces shall be connected to an insulated equipment grounding conductor in accordance with 250.146(D) in addition to the two equipment grounding conductor paths required in 517.13(A). The insulated grounding conductor required in 517.13(B)(1) shall be clearly identified using green insulation, with no yellow stripes, along its entire length and shall not be connected to the grounding terminals of isolated ground receptacles but shall be connected to the box or enclosure indicated in 517.13 (B)(1)(2) and to non-current-carrying conductive surfaces of fixed electrical equipment indicated in 517.13(B)(1)(3).

(2) The equipment grounding conductor installed for conductor connected to the grounding terminal of isolated grounding receptacles in patient care areas shall be clearly identified using green insulation with one or more yellow stripes along its entire length.

Informational Note No. 1: This type of installation is typically used where a reduction of electrical noise (electromagnetic interference) is necessary, and parallel grounding paths are to be avoided.

Informational Note No. 2: Care should be taken in specifying a system containing isolated ground receptacles, because the grounding impedance is controlled only by the grounding wires and does not benefit from any conduit or building structure in parallel with the grounding path. [99:A.6.3.2.2.7.1]

Statement of Problem and Substantiation for Public Comment

It is unclear by FR4260 where the grounding path of referenced NEC® 517.13(B)(1) [green unstriped conductor] of FR4261 is terminated. Effectively, NEC® 517.16(B)(2) mandates BOTH an insulated grounding conductor identified green with yellow stripes AND an insulated grounding conductor identified as green (without yellow striping) per NEC® 517.13(B)(1)(1) to connect to the isolated ground receptacle's GROUNDING TERMINAL. This is wrong as it would defeat the isolated grounding of an IG receptacle per NEC® 250.146(D).

Editorial: Use term “isolated ground receptacles” for consistency throughout NEC® 517.16 and with NEC® 250.146(D).

Committee Statement
Committee Action: Rejected but see related SR
Resolution: SR-4217-NFPA 70-2015
Statement: This revision provides necessary clarity to First Revision No. 4260-NFPA 70-2015 (Section No. 517.6) and correlates with 517.13.

CMP-15 has clarified that the equipment grounding conductor path referenced in 517.13(B)(1) [green unstriped insulated conductor] shall not be incorrectly terminated to the Isolated Ground receptacle’s grounding terminal. This connection is to be made to the metal box or enclosure to which the Isolated Ground receptacle’s mounting means connects to the strap of the receptacle and bonds the faceplate.

517.16(B)(2) mandates “both” an insulated grounding conductor identified green with yellow stripes that is to be connected to the grounding terminal of the isolated ground receptacle “and” an insulated grounding conductor identified...
as green (without yellow striping) per NEC® 517.13(B)(1)(1) methods be used for this installation. If the isolated ground conductor is connected to the metal box and the isolated ground terminal, such a connection would negate the isolated grounding of an Isolated Ground receptacle established by NEC® 250.146(D).

Editorial changes include:

Use the term “isolated ground receptacles” for consistency throughout NEC® 517.16 and with NEC® 250.146(D) as directed by the Correlating Committee.

Further, the term “patient care areas” in NEC® 517.16(B)(2) should be consistent with “patient care spaces” now used in Article 517.
The equipment grounding conductor installed for isolated grounding receptacles in patient care areas shall be clearly identified using green insulation with one or more yellow stripes along its entire length.

Informational Note No. 1: This type of installation is typically used where a reduction of electrical noise (electromagnetic interference) is necessary, and parallel grounding paths are to be avoided.

Informational Note No. 2: Care should be taken in specifying a system containing isolated ground receptacles, because the grounding impedance is controlled only by the grounding wires and does not benefit from any conduit or building structure in parallel with the grounding path. [99: A.6.3.2.2.7.1]

Statement of Problem and Substantiation for Public Comment

Delete Informational Note 1 because an isolated ground installation 'does not' reduce electric noise. I challenge all of the panel members to publically write out and explain this concept. This is just a myth that has been passed along and people accept the concept, but for sure they don't know what it means.

Delete Informational Note 2 because it appears that the panel is concerned that installing such a system is not a good idea. If the system is specified and installed per the NEC than it must be safe.

Committee Statement

Committee Action: Rejected
Resolution: The submitter has not provided any evidence or factual studies to support the claim as stated in the Public Comment. Informational Note No. 2 is extracted material from NFPA 99, Health Care Facilities Code. The submitter is encouraged to provide further material and submit substantiation to the NFPA 99 ELS Committee addressing the concern regarding claims stated in the Public Comment.
The equipment grounding conductor installed for isolated grounding receptacles in patient care areas, care spaces, shall be clearly identified using green insulation with one or more yellow stripes along its entire length.

Informational Note No. 1: This type of installation is typically used where a reduction of electrical noise (electromagnetic interference) is necessary, and parallel grounding paths are to be avoided.

Informational Note No. 2: Care should be taken in specifying a system containing isolated ground receptacles, because the grounding impedance is controlled only by the grounding wires and does not benefit from any conduit or building structure in parallel with the grounding path. [99:A.6.3.2.2.7.1]

Statement of Problem and Substantiation for Public Comment

The text at 517.16(B)(2) references a patient care "area." By Article 517 definitions, is this not a patient care "space?" CMP-15 has gone to great lengths in the past few Code cycles to change terms like "patient care areas" to "patient care spaces" to reflect NFPA 99 terms in the NEC. This is small, but will aid in that effort.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4217-NFPA 70-2015
Statement: This revision provides necessary clarity to First Revision No. 4260-NFPA 70-2015 (Section No. 517.6) and correlates with 517.13.

CMP-15 has clarified that the equipment grounding conductor path referenced in 517.13(B)(1) [green unstriped insulated conductor] shall not be incorrectly terminated to the Isolated Ground receptacle’s grounding terminal. This connection is to be made to the metal box or enclosure to which the Isolated Ground receptacle’s mounting means connects to the strap of the receptacle and bonds the faceplate.

517.16(B)(2) mandates “both” an insulated grounding conductor identified green with yellow stripes that is to be connected to the grounding terminal of the isolated ground receptacle “and” an insulated grounding conductor identified as green (without yellow striping) per NEC® 517.13(B)(1)(1) methods be used for this installation. If the isolated ground conductor is connected to the metal box and the isolated ground terminal, such a connection would negate the isolated grounding of an Isolated Ground receptacle established by NEC® 250.146(D).

Editorial changes include:

Use the term “isolated ground receptacles” for consistency throughout NEC® 517.16 and with NEC® 250.146(D) as directed by the Correlating Committee.

Further, the term “patient care areas” in NEC® 517.16(B)(2) should be consistent with “patient care spaces” now used in Article 517.
Public Comment No. 765-NFPA 70-2015 [Section No. 517.16(B)(2)]

(2)
The equipment grounding conductor installed for to the grounding terminal of isolated grounding receptacles in patient care areas shall be clearly identified using green insulation with one or more yellow stripes along its entire length.

Informational Note No. 1: This type of installation is typically used where a reduction of electrical noise (electromagnetic interference) is necessary, and parallel grounding paths are to be avoided.

Informational Note No. 2: Care should be taken in specifying a system containing isolated ground receptacles, because the grounding impedance is controlled only by the grounding wires and does not benefit from any conduit or building structure in parallel with the grounding path. [99:A.6.3.2.2.7.1]

Statement of Problem and Substantiation for Public Comment

Changing the language as shown will provide clear instructions to installers and inspectors that the isolated equipment grounding conductor connected to the grounding terminal of the receptacle is required to have green insulation with a yellow stripe.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4217-NFPA 70-2015
Statement: This revision provides necessary clarity to First Revision No. 4260-NFPA 70-2015 (Section No. 517.6) and correlates with 517.13.

CMP-15 has clarified that the equipment grounding conductor path referenced in 517.13(B)(1) [green unstriped insulated conductor] shall not be incorrectly terminated to the Isolated Ground receptacle’s grounding terminal. This connection is to be made to the metal box or enclosure to which the Isolated Ground receptacle’s mounting means connects to the strap of the receptacle and bonds the faceplate.

517.16(B)(2) mandates “both” an insulated grounding conductor identified green with yellow stripes that is to be connected to the grounding terminal of the isolated ground receptacle “and” an insulated grounding conductor identified as green (without yellow stripping) per NEC® 517.13(B)(1)(1) methods be used for this installation. If the isolated ground conductor is connected to the metal box and the isolated ground terminal, such a connection would negate the isolated grounding of an Isolated Ground receptacle established by NEC® 250.146(D).

Editorial changes include:

Use the term “isolated ground receptacles” for consistency throughout NEC® 517.16 and with NEC® 250.146(D) as directed by the Correlating Committee.

Further, the term “patient care areas” in NEC® 517.16(B)(2) should be consistent with “patient care spaces” now used in Article 517.
Public Comment No. 1483-NFPA 70-2015 [Section No. 517.17(A)]

(A) Applicability.

The requirements of 517.17 shall apply to hospitals, and other buildings (including multiple-occupancy buildings) with critical care (Category 1) spaces or utilizing electrical life-support equipment, and buildings that provide the required essential utilities or services for the operation of critical care (Category 1) spaces or electrical life-support equipment.

Statement of Problem and Substantiation for Public Comment

For consistency with NFPA 99 the terms "critical, basic, general" etc should be removed which is no longer used in the standard to describe function of spaces.

Committee Statement

Committee Action: Rejected
Resolution: In accordance with 4.3.3 of the National Electrical Code® Style Manual and 2.3.2.11 of the Manual of Style for NFPA Technical Committee Documents regarding extracted materials, the consent of the NFPA 99 Fundamentals Technical Committee, as the committee responsible for the source document, was sought and obtained to use parenthetic references between specific older and current NFPA 99 terminology during a transition to current NFPA 99 terminology in the National Electrical Code®. [Ref. Minutes of NFPA Technical Committee on Fundamentals (HEA-FUN), August 13, 2015, Item 7] This written permission is documented in the attachments submitted with Public Comment PC 1175. See the Second Revision created to 517.2 (Patient Care Space).
517.18 General Care (Category 2) Spaces.

(A) Patient Bed Location.

Each patient bed location shall be supplied by at least two branch circuits, one from the critical branch and one from the normal system. All branch circuits from the normal system shall originate in the same panelboard. The electrical receptacles or the cover plate for the electrical receptacles supplied from the critical branch shall have a distinctive color or marking so as to be readily identifiable and shall also indicate the panelboard and branch-circuit number supplying them.

Branch circuits serving patient bed locations shall not be part of a multiwire branch circuit.

Exception No. 1: Branch circuits serving only special purpose outlets or receptacles, such as portable X-ray outlets, shall not be required to be served from the same distribution panel or panels.

Exception No. 2: The requirements of 517.18(A) shall not apply to patient bed locations in clinics, medical and dental offices, and outpatient facilities; psychiatric, substance abuse, and rehabilitation hospitals; sleeping rooms of nursing homes; and limited care facilities meeting the requirements of 517.10(B)(2).

Exception No. 3: A general care (Category 2) patient bed location served from two separate transfer switches on the critical branch shall not be required to have circuits from the normal system.

(B) Patient Bed Location Receptacles.

Each patient bed location shall be provided with a minimum of eight receptacles. They shall be permitted to be of the single, duplex, or quadruplex type or any combination of the three. All receptacles shall be listed “hospital grade” and shall be so identified. The grounding terminal of each receptacle shall be connected to an insulated copper equipment grounding conductor sized in accordance with Table 250.122.

Exception No. 1: The requirements of 517.18(B) shall not apply to psychiatric, substance abuse, and rehabilitation hospitals meeting the requirements of 517.10(B)(2).

Exception No. 2: Psychiatric security rooms shall not be required to have receptacle outlets installed in the room.

Informational Note: It is not intended that there be a total, immediate replacement of existing non–hospital grade receptacles. It is intended, however, that non–hospital grade receptacles be replaced with hospital grade receptacles upon modification of use, renovation, or as existing receptacles need replacement.

(C) Designated General Care (Category 2) Pediatric Locations.

Receptacles that are located within the patient rooms, bathrooms, playrooms, and activity rooms of pediatric units or spaces with similar risk as determined by the governing body, other than nurseries, shall be listed tamper-resistant or shall employ a listed tamper-resistant cover. [99:6.3.2.6.2(F)]

**Statement of Problem and Substantiation for Public Comment**

Being that in a hospital specially servicing the needs of children, they are likely to be in most all areas of a pediatric hospital or clinic, especially common areas such as cafeteria, lobby, halls, etc. By requiring tamper-resistant receptacles throughout will lessen the chance of a child suffering burns or electrician.

Sections 517.19, 517.19

517.19 Critical Care (Category 1) Spaces.

(A) Patient Bed Location Branch Circuits.

Each patient bed location shall be supplied by at least two branch circuits, one or more from the critical branch and one or more circuits from the normal system. At least one branch circuit from the critical branch shall supply an outlet(s) only at that bed location.

The electrical receptacles or the cover plates for the electrical receptacles supplied from the life safety and critical branches shall have a distinctive color or marking so as to be readily identifiable. [99:6.4.2.2.6.2(C)]

All branch circuits from the normal system shall be from a single panelboard. Critical branch receptacles shall be identified and shall also indicate the panelboard and circuit number supplying them.

The branch circuit serving patient bed locations shall not be part of a multiwire branch circuit.

Exception No. 1: Branch circuits serving only special-purpose receptacles or equipment in critical care (Category 1) spaces shall be permitted to be served by other panelboards.

Exception No. 2: Critical care (Category 1) spaces served from two separate critical branch transfer switches shall not be required to have circuits from the normal system.

(B) Patient Bed Location Receptacles.

(1) Minimum Number and Supply.

Each patient bed location shall be provided with a minimum of 14 receptacles, at least one of which shall be connected to either of the following:

(1) The normal system branch circuit required in 517.19(A)

(2) A critical branch circuit supplied by a different transfer switch than the other receptacles at the same patient bed location

(2) Receptacle Requirements.

The receptacles required in 517.19(B)(1) shall be permitted to be single, duplex, or quadruplex type or any combination thereof. All receptacles shall be listed “hospital grade” and shall be so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of an insulated copper equipment grounding conductor.

(C) Operating Room Receptacles.
(1) Minimum Number and Supply.
Each operating room shall be provided with a minimum of 36 receptacles divided between at least two branch circuits. At least 12 receptacles, but no more than 24, shall be connected to either of the following:
(1) The normal system branch circuit required in 517.19(A)
(2) A critical branch circuit supplied by a different transfer switch than the other receptacles at the same location

(2) Receptacle Requirements.
The receptacles shall be permitted to be of the locking or nonlocking type, single, duplex, or quadruplex types or any combination of the three.
All nonlocking-type receptacles shall be listed hospital grade and so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of an insulated copper equipment grounding conductor.

(D) Patient Care Vicinity Grounding and Bonding (Optional).
A patient care vicinity shall be permitted to have a patient equipment grounding point. The patient equipment grounding point, where supplied, shall be permitted to contain one or more listed grounding and bonding jacks. An equipment bonding jumper not smaller than 10 AWG shall be used to connect the grounding terminal of all grounding-type receptacles to the patient equipment grounding point. The bonding conductor shall be permitted to be arranged centrically or looped as convenient.
Informational Note: Where there is no patient equipment grounding point, it is important that the distance between the reference grounding point and the patient care vicinity be as short as possible to minimize any potential differences.

(E) Equipment Grounding and Bonding.
Where a grounded electrical distribution system is used and metal feeder raceway or Type MC or MI cable that qualifies as an equipment grounding conductor in accordance with 250.118 is installed, grounding of enclosures and equipment, such as panelboards, switchboards, and switchgear, shall be ensured by one of the following bonding means at each termination or junction point of the metal raceway or Type MC or MI cable:
(1) A grounding bushing and a continuous copper bonding jumper, sized in accordance with 250.122, with the bonding jumper connected to the junction enclosure or the ground bus of the panel
(2) Connection of feeder raceways or Type MC or MI cable to threaded hubs or bosses on terminating enclosures
(3) Other approved devices such as bonding-type locknuts or bushings. Standard locknuts shall not be used for bonding.

(F) Additional Protective Techniques in Critical Care (Category 1) Spaces (Optional).
Isolated power systems shall be permitted to be used for critical care (Category 1) spaces, and, if used, the isolated power system equipment shall be listed as isolated power equipment. The isolated power system shall be designed and installed in accordance with 517.160.
Exception: The audible and visual indicators of the line isolation monitor shall be permitted to be located at the nursing station for the area being served.

(G) Isolated Power System Equipment Grounding.
Where an isolated ungrounded power source is used and limits the first-fault current to a low magnitude, the equipment grounding conductor associated with the secondary circuit shall be permitted to be run outside of the enclosure of the power conductors in the same circuit.
Informational Note: Although it is permitted to run the grounding conductor outside of the conduit, it is safer to run it with the power conductors to provide better protection in case of a second ground fault.

(H) Special-Purpose Receptacle Grounding.
The equipment grounding conductor for special-purpose receptacles, such as the operation of mobile X-ray equipment, shall be extended to the reference grounding points of branch circuits for all locations likely to be served from such receptacles. Where such a circuit is served from an isolated ungrounded system, the grounding conductor shall not be required to be run with the power conductors; however, the equipment grounding terminal of the special-purpose receptacle shall be connected to the reference grounding point.
517.19 Critical Care (Category 1) Spaces.
(A) Patient Bed Location Branch Circuits.

Each patient bed location shall be supplied by at least two branch circuits, one or more from the critical branch and one or more circuits from the normal system. At least one branch circuit from the critical branch shall supply an outlet(s) only at that bed location.

The electrical receptacles or the cover plates for the electrical receptacles supplied from the life safety and critical branches shall have a distinctive color or marking so as to be readily identifiable. [99:6.4.2.2.6.2(C)]

All branch circuits from the normal system shall be from a single panelboard. Critical branch receptacles shall be identified and shall also indicate the panelboard and circuit number supplying them.

The branch circuit serving patient bed locations shall not be part of a multiwire branch circuit.

Exception No. 1: Branch circuits serving only special-purpose receptacles or equipment in critical care (Category 1) spaces shall be permitted to be served by other panelboards.

Exception No. 2: Critical care (Category 1) spaces served from two separate critical branch transfer switches shall not be required to have circuits from the normal system.

(B) Patient Bed Location Receptacles.

(1) Minimum Number and Supply.

Each patient bed location shall be provided with a minimum of 14 receptacles, at least one of which shall be connected to either of the following:

(1) The normal system branch circuit required in 517.19(A)

(2) A critical branch circuit supplied by a different transfer switch than the other receptacles at the same patient bed location

(2) Receptacle Requirements.

The receptacles required in 517.19(B)(1) shall be permitted to be single, duplex, or quadruplex type or any combination thereof. All receptacles shall be listed “hospital grade” and shall be so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of an insulated copper equipment grounding conductor.

(C) Operating Room Receptacles.
Minimum Number and Supply.

Each operating room shall be provided with a minimum of 36 receptacles divided between at least two branch circuits. At least 12 receptacles, but no more than 24, shall be connected to either of the following:

1. The normal system branch circuit required in 517.19(A)
2. A critical branch circuit supplied by a different transfer switch than the other receptacles at the same location

Receptacle Requirements.

The receptacles shall be permitted to be of the locking or nonlocking type, single, duplex, or quadruplex types or any combination of the three.

All nonlocking-type receptacles shall be listed hospital grade and so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of an insulated copper equipment grounding conductor.

Patient Care Vicinity Grounding and Bonding (Optional).

A patient care vicinity shall be permitted to have a patient equipment grounding point. The patient equipment grounding point, where supplied, shall be permitted to contain one or more listed grounding and bonding jacks. An equipment bonding jumper not smaller than 10 AWG shall be used to connect the grounding terminal of all grounding-type receptacles to the patient equipment grounding point. The bonding conductor shall be permitted to be arranged centrally or looped as convenient.

Informational Note: Where there is no patient equipment grounding point, it is important that the distance between the reference grounding point and the patient care vicinity be as short as possible to minimize any potential differences.

Equipment Grounding and Bonding.

Where a grounded electrical distribution system is used and metal feeder raceway or Type MC or MI cable that qualifies as an equipment grounding conductor in accordance with 250.118 is installed, grounding of enclosures and equipment, such as panelboards, switchboards, and switchgear, shall be ensured by one of the following bonding means at each termination or junction point of the metal raceway or Type MC or MI cable:

1. A grounding bushing and a continuous copper bonding jumper, sized in accordance with 250.122, with the bonding jumper connected to the junction enclosure or the ground bus of the panel
2. Connection of feeder raceways or Type MC or MI cable to threaded hubs or bosses on terminating enclosures
3. Other approved devices such as bonding-type locknuts or bushings. Standard locknuts shall not be used for bonding.

Isolated Power System Equipment Grounding.

Where an isolated ungrounded power source is used and limits the first-fault current to a low magnitude, the equipment grounding conductor associated with the secondary circuit shall be permitted to be run outside of the enclosure of the power conductors in the same circuit.

Informational Note: Although it is permitted to run the grounding conductor outside of the conduit, it is safer to run it with the power conductors to provide better protection in case of a second ground fault.

Special-Purpose Receptacle Grounding.

The equipment grounding conductor for special-purpose receptacles, such as the operation of mobile X-ray equipment, shall be extended to the reference grounding points of branch circuits for all locations likely to be served from such receptacles. Where such a circuit is served from an isolated ungrounded system, the grounding conductor shall not be required to be run with the power conductors; however, the equipment grounding terminal of the special-purpose receptacle shall be connected to the reference grounding point.

Statement of Problem and Substantiation for Public Comment

For consistency with NFPA 99 the terms "critical, basic, general" etc should be removed which is no longer used in the standard to describe function of spaces.

See the Second Revision created to 517.2 (Patient Care Space).
517.30 Sources of Power.

(A) Two Independent Power Sources.

Essential electrical systems shall have a minimum of the following two independent sources of power: a normal source generally supplying the entire electrical system and one alternate source(s) for use when the normal source is interrupted. \[99:6.4.1.1.4\]

(B) Types of Power Sources.

(1) Where the normal source consists of generating units on the premises, the alternate source shall be either another generating set or an external utility service. \[99:6.4.1.1.5\]

(2) Fuel Cell Systems.

Fuel cell systems shall be permitted to serve as the alternate source for all or part of an essential electrical system, provided the following conditions apply:

1. Installation shall comply with NFPA 853, Standard for installation of Stationary Fuel Cell Power Systems.
2. \(N\) units shall be provided where \(N\) units have sufficient capacity to supply the demand load of the portion of the system served.
3. System shall be able to assume loads within 10 seconds of loss of normal power source.
4. System shall have a continuing source of fuel supply, together with sufficient on-site fuel storage for the essential system type.
5. A connection shall be provided for a portable diesel generator to supply life safety and critical portions of the distribution system. \[99:6.4.1.1.7(1) through (5)\]

- Fuel cell systems shall be listed for emergency system use.

(C) Location of Essential Electrical System Components.

Essential electrical system components shall be located to minimize interruptions caused by natural forces common to the area (e.g., storms, floods, earthquakes, or hazards created by adjoining structures or activities). Installations of electrical services shall be located to reduce possible interruption of normal electrical services resulting from similar causes as well as possible disruption of normal electrical service due to internal wiring and equipment failures. Feeders shall be located to provide physical separation of the feeders of the alternate source and from the feeders of the normal electrical source to prevent possible simultaneous interruption.

Informational Note: Facilities in which the normal source of power is supplied by two or more separate central station-fed services experience greater than normal electrical service reliability than those with only a single feed. Such a dual source of normal power consists of two or more electrical services fed from separate generator sets or a utility distribution network that has multiple power input sources and is arranged to provide mechanical and electrical separation so that a fault between the facility and the generating sources is not likely to cause an interruption of more than one of the facility service feeders.

Statement of Problem and Substantiation for Public Comment

The text as written in the first revision does not match the extracted text from NFPA 99 6.4.1.1.7. This change aligns this section with the extracted text with consideration to the NEC MOS.

Submittal Date: Fri Sep 25 13:16:10 EDT 2015
Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4225-NFPA 70-2015
Statement: The NFPA 99 requirement for installation compliance with NFPA 853 was inadvertently omitted and 517.30(A) is revised accordingly.

The requirement for fuel cell systems being listed for emergency use is specifically retained. This requirement is clearly outside of the cited extracted text for NFPA 70-2017, and the same requirement has been explicitly added to 6.4.1.1.7 per First Revision FR 19 of NFPA 99-2018, where wording has been revised accordingly. Furthermore, this is a requirement pertaining to the installation of equipment. In accordance with Standards Council Decision SD-11-7, NFPA 70 Code-Making Panel 15 has authority to set installation requirements of equipment in health care facilities.

This action meets the intent of the CC PC-1817 relative to “or more”.
The number of transfer switches to be used shall be based on reliability and design. Each branch of the essential electrical system shall have one or more transfer switches. Transfer equipment shall meet the requirements in 700.5(A), (B), and (C) where commercially available.

One transfer switch and downstream distribution system shall be permitted to serve one or more branches in a facility with a maximum demand on the essential electrical system of 150 kVA.

Informational Note No. 1: See NFPA 99-2015, Health Care Facilities Code, 6.4.3.2, Transfer Switches; 6.4.2.1.5, Automatic Transfer Switch Features; 6.4.2.1.5.15, Nonautomatic Transfer Switch Features; and 6.4.2.1.7, Nonautomatic Transfer Device Features.

Informational Note No. 2: See Informational Note Figure 517.31(a).

Informational Note No. 3: See Informational Note Figure 517.31(b).

Statement of Problem and Substantiation for Public Comment

The 2015 NFPA 99 at (6.4.2.2.1.5) states that Article 700 shall only apply to the life safety branch.
Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4218-NFPA 70-2015
Statement: NFPA 99:6.4.2.2.1.5 states that NFPA 70, Article 700 shall only apply to the life safety branch. CMP-15 deletes the last sentence added in the FR, ("Only Transfer equipment on the life safety branch shall meet the requirements in 700.5(A), (B), and (C) where commercially available.") as it not consistent with the requirements of NFPA 99.
Public Comment No. 675-NFPA 70-2015 [Section No. 517.31(C)(3)]

(3) Mechanical Protection of the Essential Electrical System.

The wiring of the life safety and critical branches shall be mechanically protected. Where installed as branch circuits in patient care spaces, the installation shall comply with the requirements of 517.13(A) and (B). Only the following wiring methods shall be permitted:

1. Nonflexible metal raceways, Type MI cable, Type RTRC marked with the suffix –XW, or Schedule 80 PVC conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

2. Where encased in not less than 50 mm (2 in.) of concrete, Schedule 40 PVC conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

3. Listed metal sheathed cable assemblies where installed in accordance with 300.4 and not subject to physical damage.

4. Listed flexible metal raceways and listed metal sheathed cable assemblies in any of the following:
   5. Where used in listed prefabricated medical headwalls
   6. In listed office furnishings
   7. Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage
   8. Where necessary for flexible connection to equipment
   9. For equipment that requires a flexible connection due to movement, vibration, or operation
   10. Luminaires installed in rigid ceiling structures where there is no access above the ceiling space after the luminaire is installed.

11. Flexible power cords of appliances or other utilization equipment connected to the emergency system.

12. Cables for Class 2 or Class 3 systems permitted by Part VI of this Article, with or without raceways.

Informational Note: See 517.13 for additional grounding requirements in patient care areas.

Statement of Problem and Substantiation for Public Comment

The Panel statement concerning product Standards and performance does not address the factual information provided by PI 341 and the original proposal from the 2014 Code Revision offering that the present Product Standard and Product Performance is adequate for the application and is proven through its approval for the use since the 2005 NEC.

Since these wiring methods have been providing acceptable service and performance since the 2005 NEC where it is fished, the concern seems to be the rigors of installation in new construction. The installation of these wiring methods in hospital construction is no more severe or damaging than their installation in any other building construction or job site where these cables are extensively used. Listed metal sheathed cable assemblies installed in accordance with the NEC 300.4 and where not subject to physical damage provides protection against mechanical damage for the Emergency System and has been doing so since the 2005 NEC.

All wiring methods can be damaged if installed in inappropriate locations. Type MC cable offers a comparable level of protection to that provided by EMT in ordinary locations and the environment of hospital construction and operation.

There is no need for a special construction of MC where used in normal construction. A higher level of performance for the cable where exposed to severe physical damage may be appropriate but is not
necessary where installed in ordinary locations such as in floors, walls, and ceilings. The requirements in 300.4 provide protection against normal physical damage during construction and operation in general locations.

Public Comment No. 868-NFPA 70-2015 [Section No. 517.31(C)(3)]

(3) Mechanical Protection of the Essential Electrical System.

The wiring of the life safety and critical branches shall be mechanically protected. Where installed as branch circuits in patient care spaces, the installation shall comply with the requirements of 517.13(A) and (B). Only the following wiring methods shall be permitted:

1. Nonflexible metal raceways, Type MI cable, Type RTRC marked with the suffix –XW, or Schedule 80 PVC conduit. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

2. Where encased in not less than 50 mm (2 in.) of concrete, Schedule 40 PVC conduit, flexible nonmetallic or jacketed metallic raceways, or jacketed metallic cable assemblies listed for installation in concrete. Nonmetallic raceways shall not be used for branch circuits that supply patient care areas.

3. Listed flexible metal raceways and listed metal sheathed cable assemblies in any of the following:
   4. Where used in listed prefabricated medical headwalls
   5. In listed office furnishings
   6. Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage
   7. Where necessary for flexible connection to equipment
   8. For equipment that requires a flexible connection due to movement, vibration, or operation
   9. Luminaires installed in rigid ceiling structures where there is no access above the ceiling space after the luminaire is installed.

10. Flexible power cords of appliances or other utilization equipment connected to the emergency system.

11. Cables for Class 2 or Class 3 systems permitted by Part VI of this Article, with or without raceways.

12. Listed MC cable identified as providing crush, impact and penetration circuit protection performance comparable to electrical metallic tubing.

Informational Note: See 517.13 for additional grounding requirements in patient care areas.

Statement of Problem and Substantiation for Public Comment

Type MC cable as shown in previous UL Fact Finding Reports can be constructed to provide enhanced mechanical protection comparable to EMT while maintaining ground path integrity before, during and after installation.

Public Comment No. 1497-NFPA 70-2015 [Section No. 517.34(A)]

(A) Task Illumination and Selected Receptacles.

The critical branch of the essential electrical system shall supply power for task illumination, fixed equipment, selected receptacles, and special power circuits serving the following areas and functions related to patient care:

1. Critical care (Category 1), spaces that utilize anesthetizing gases, task illumination, selected receptacles, and fixed equipment

2. The isolated power systems in special environments

3. Patient care spaces, task illumination, and selected receptacles in the following:
   a. Infant nurseries
   b. Medication preparation areas
   c. Pharmacy dispensing areas
   d. Selected acute nursing areas
   e. Psychiatric bed areas (omit receptacles)
   f. Ward treatment rooms
   g. Nurses' stations (unless adequately lighted by corridor luminaires)

4. Additional specialized patient care task illumination and receptacles, where needed

5. Nurse call systems

6. Blood, bone, and tissue banks

7. Telephone and data equipment rooms and closets

8. Task illumination, selected receptacles, and selected power circuits for the following:
   a. General care (Category 2) beds
      i. Category 2 beds (at least one duplex receptacle in each patient bedroom)
      ii. Aniographic labs
      iii. Cardiac catheterization labs
      iv. Coronary care units
      v. Hemodialysis rooms or areas
      vi. Emergency room treatment areas (selected)
      vii. Human physiology labs
      viii. Intensive care units
      ix. Postoperative recovery rooms (selected)

Statement of Problem and Substantiation for Public Comment

For consistency with NFPA 99 the terms "critical, basic, general" etc should be removed which is no longer used in the standard to describe function of spaces.

Submittal Date: Fri Sep 25 17:38:56 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: Permitting switched task illumination circuits provides important coordination with NFPA 99. CMP-15 notes that the Public Comment 1716 relates to 517.33(B) and not 517.34(B).
The equipment branch shall be installed and connected to the alternate power source such that the equipment described in
517.35(A) is automatically restored to operation at appropriate time-lag intervals following the energizing of the essential
electrical system. Its arrangement shall also provide for the subsequent connection of equipment described in 517.35(B).

Exception: For essential electrical systems under 150 kVA, deletion of the time-lag intervals feature for delayed automatic
connection to the equipment system shall be permitted.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that this First Revision be reconsidered with regard to the deletion of the term "or more" and to
correlate with FR 4279. Section 3.2.7.3.2 of the NFPA style manual requires the "context of the original material not be compromised or
violated."

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4225-NFPA 70-2015
Statement: The NFPA 99 requirement for installation compliance with NFPA 853 was inadvertently omitted and 517.30(A) is revised
accordingly.

The requirement for fuel cell systems being listed for emergency use is specifically retained. This requirement is clearly
outside of the cited extracted text for NFPA 70-2017, and the same requirement has been explicitly added to 6.4.1.1.7 per
First Revision FR 19 of NFPA 99-2018, where wording has been revised accordingly. Furthermore, this is a requirement
pertaining to the installation of equipment. In accordance with Standards Council Decision SD-11-7, NFPA 70
Code-Making Panel 15 has authority to set installation requirements of equipment in health care facilities.

This action meets the intent of the CC PC-1817 relative to "or more".
Public Comment No. 1665-NFPA 70-2015 [Section No. 517.42(A)]

(A) General.

Essential electrical systems for nursing homes and limited care facilities shall be divided into the following two branch
circuits branches, the life safety branch and the equipment branch. [99:A.6.5.2.2.1.2]

The division between the branches shall occur at transfer switches where more than one transfer switch is required.

Informational Note No. 1: Essential electrical systems are comprised of two separate branches capable of supplying a
limited amount of lighting and power service, which is considered essential for the protection of life and safety and
effective operation of the institution during the time normal electrical service is interrupted for any reason.

Informational Note No. 2: For more information see NFPA 99-2015, Health Care Facilities Code [99:A.6.5.2.1.1]

Statement of Problem and Substantiation for Public Comment

Requiring the essential systems to be two branch circuits is unnecessarily limiting. Similar to the language of 517.30(B) the separation is
simply into two branches.

Public Comment No. 1525-NFPA 70-2015 [Section No. 517.45]

517.45 Essential Electrical Systems for Other Health Care Facilities.

(A) Essential Electrical Distribution.
If required by the governing body, the essential electrical distribution system for basic care (Category 3) patient care spaces shall be comprised of an alternate power system capable of supplying a limited amount of lighting and power service for the orderly cessation of procedures during a time normal electrical service is interrupted.

(B) Electrical Life Support Equipment.
Where electrical life support equipment is required, the essential electrical distribution system shall be as described in 517.29 through 517.30.

(C) Critical Care (Category 1) Patient Care Spaces.
Where critical patient care (Category 1) spaces are present, the essential electrical distribution system shall be as described in 517.29 through 517.30.

(D) General Care (Category 2) Patient Care Spaces.
Where general care (Category 2) patient care spaces are present, the essential electrical distribution system shall be as described in 517.40 through 517.45.

(E) Power Systems.
If required, alternate power sources acceptable to the governing body shall comply with the requirements of NFPA 99-2015, Health Care Facilities Code.

Statement of Problem and Substantiation for Public Comment

For consistency with NFPA 99 the terms "critical, basic, general" etc should be removed which is no longer used in the standard to describe function of spaces.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacturer remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL's Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacturer remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

(C) Over 2000-Volt Supply.
Circuits and equipment operated on a supply circuit of over 2000 volts shall comply with Article 490.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that this First Revision be reconsidered. Code-making Panel 9 did not change the title of Article 490 and its scope covers equipment over 1000 volts.

Statement: CMP-15 makes this revision to correlate with Article 490.
Adapter.
A device used to adapt a circuit from one configuration of an attachment plug or receptacle to another configuration with the same current rating.

Statement of Problem and Substantiation for Public Comment
The Correlating Committee directs that the panel reconsider the definition of “adapter” related to multiple different uses of the term throughout Article 520.

Submittal Date: Tue Sep 29 09:53:47 EDT 2015

Committee Statement
Committee Action: Rejected but see related SR
Resolution: SR-4227-NFPA 70-2015
Statement: The Correlating Committee correctly pointed out a conflict between First Revision addition of “adapter” definition and other uses of “adapter” in article 520. This Second Revision change to the definition of “Two-Fer” (the only conflicting use of “adapter”) is required to correct that conflict.
Section 520.9, Branch Circuits.

A branch circuit of any size supplying one or more receptacles shall be permitted to supply stage set lighting. The voltage rating of the receptacles shall be not less than the circuit voltage. Receptacle ampere ratings and branch-circuit conductor ampacity shall be not less than the branch-circuit overcurrent device ampere rating. Table 210.21(B)(2) and Section 210.23 shall not apply. Section 210.8(B) shall be permitted but not required.

Statement of Problem and Substantiation for Public Comment

This comment retains the current requirements. No justification was made for increasing the requirements in this Article imposed by changes in 210.8(B).

Submittal Date: Wed Sep 23 01:47:58 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4203-NFPA 70-2015
Statement: Section 210.8(B)(3)(d) was changed in the First Revision to add requirements for GFCI protection on all outdoor branch circuits. No technical substantiation was provided to warrant the addition of these requirements to section 520.9. In addition, due to the nature of the equipment used in venues covered by article 520 such as phase-controlled dimmed branch circuits, there is typically no practical way to comply with the new requirements of section 210.8(B)(3)(d).
520.21 General.
Fixed stage switchboards shall comply with 520.21(1) through (4):

(1) Fixed stage switchboards shall be listed and labeled.

(2) Fixed stage switchboards shall be readily accessible but shall not be required to be located on or adjacent to the stage. Multiple fixed stage switchboards shall be permitted at different locations.

(3) A fixed stage switchboard shall contain overcurrent protective devices for all branch circuits supplied by that switchboard.

(4) A fixed stage switchboard shall be permitted to supply both stage and non-stage equipment.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. “Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. </table>

Note: Ultimate insulation temperature. In no case shall conductors be associated together in such a way with respect to the kind of circuit, the wiring method used, or the number of conductors such that the temperature limit of the conductors is exceeded.

A neutral conductor that carries only the unbalanced current from other conductors of the same circuit need not be considered as a current-carrying conductor.

In a 3-wire circuit consisting of 2-phase conductors and the neutral conductor of a 4-wire, 3-phase, wye-connected system, the neutral conductor carries approximately the same current as the line-to-neutral currents of the other conductors and shall be considered to be a current-carrying conductor.

On a 4-wire, 3-phase wye circuit where the major portion of the load consists of nonlinear loads, there are harmonic currents in the neutral conductor. Therefore, the neutral conductor shall be considered to be a current-carrying conductor.

Informational Note: For the purposes of Table 520.44(C)(3)(a), load diversity is the percentage of the total current of all simultaneously energized circuits fed by the cable to the sum of the ampacity ratings of all circuits in that cable.

Statement of Problem and Substantiation for Public Comment

The phrase "... load diversity is a minimum of 50% or less, ..." is somewhat self-contradictory. Clarifying the language to read "... load diversity of 50% or less, ..." was the intention of the Panel in the FR.

Public Comment No. 1166-NFPA 70-2015 [Section No. 520.68(B)]

(B) Conductor Ampacity.

The ampacity of conductors shall be as given in 400.5, except multiconductor, listed, extra-hard usage portable cords that are not in direct contact with equipment containing heat-producing elements shall be permitted to have their ampacity determined by Table 520.44(C)(3). Maximum load current in any conductor with an ampacity determined by Table 520.44(C)(3) shall not exceed the values in Table 520.44(C)(3). Where the ampacity adjustment factors of Table 520.44(C)(3)(a) are applied for more than three current-carrying conductors in a portable cord, the load diversity shall be 50 percent or less.

Exception: Where alternate conductors are allowed in 520.68(A)(3), their ampacity shall be as given in the appropriate table in this Code for the types of conductors employed.

Statement of Problem and Substantiation for Public Comment

Editorial correction - the Exception refers to the wrong section. 520.68(A)(4) was 520.68(A)(3) prior to insertion of the current 520.68(A)(3) ‘Luminaire Supply Cords.’ This edit corrects the reference.

Public Comment No. 806-NFPA 70-2015 [Definition: Operator.]

Operator (as related to carnivals, circuses, fairs and similar events).
The individual responsible for starting, stopping, and controlling an amusement ride or supervising a concession.

Statement of Problem and Substantiation for Public Comment

All NFPA definitions are incorporated without change or comment into the NFPA Glossary of terms which simply indicates the code or standard where the definition originates. The definition of operator in the NEC can refer to multiple occupations and is not unique to article 525. If the panel wants to identify it in a different way, that would still comply with the concept that "operator" is too generic a term to stay as a definition that applies solely to a carnival operator.

Committee Statement

Committee Action: Rejected
Resolution: The definition of "Operator" is inherently limited to article 525 venues due to its location in 525.2 as well as by the wording of the definition itself. The parenthetical modification of the definition proposed by the commenter is not needed, as it is clear as currently written.
Portable Structures (as related to carnivals, circuses, fairs and similar events)

Units designed to be moved including, but not limited to, amusement rides, attractions, concessions, tents, trailers, trucks, and similar units.

Statement of Problem and Substantiation for Public Comment

All NFPA definitions are incorporated without change or comment into the NFPA Glossary of terms which simply indicates the code or standard where the definition originates. The definition of portable structures in the NEC can refer to multiple structures and is not unique to article 525. If the panel wants to identify it in a different way, that would still comply with the concept that "portable structures" is too generic a term to stay as a definition that applies solely to carnival portable structures.

Resolution: The definition of “Portable Structure” is inherently limited to article 525 venues due to its location in 525.2 as well as by the wording of the definition itself. The parenthetical modification of the definition proposed by the commenter is not needed, as it is clear as currently written.
525.23  Ground-Fault Circuit-Interrupter (GFCI) Protection.

Where GFCI protection is provided through the use of GFCI receptacles, and the branch circuits supplying receptacles utilize flexible cord, the receptacles shall be identified for portable use.

(A) Where GFCI Protection Is Required.

GFCI protection for personnel shall be provided for the following:

(1) All 125-volt, single-phase, 15- and 20-ampere non-locking-type receptacles used for disassembly and reassembly or readily accessible to the general public

(2) Equipment that is readily accessible to the general public and supplied from a 125-volt, single-phase, 15- or 20-ampere branch circuit

The GFCI shall be permitted to be an integral part of the attachment plug or located in the power-supply cord within 300 mm (12 in.) of the attachment plug. Listed cord sets incorporating GFCI for personnel shall be permitted.

(B) Where GFCI Protection Is Not Required.

Receptacles that are not accessible from grade level and that only facilitate quick disconnecting and reconnecting of electrical equipment shall not be required to be provided with GFCI protection. These receptacles shall be of the locking type.

(C) Where GFCI Protection Is Not Permitted.

Egress lighting shall not be protected by a GFCI.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that further consideration be given to new initial paragraph in 525.23 relative to the first level subdivision numbering and titles to comply with 2.1.5.3 of the NEC Style Manual.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4209-NFPA 70-2015
Statement: Section 210.8(B)(3)(d) was changed in the First Revision to add requirements for GFCI protection on all outdoor branch circuits. No technical substantiation was provided to warrant the addition of these requirements to section 530.23. In addition, due to the nature of the equipment used in venues covered by article 530 such as phase-controlled dimmed branch circuits, there is typically no practical way to comply with the new requirements of section 210.8(B)(3)(d).
Public Comment No. 1282-NFPA 70-2015 [Section No. 540.20]

540.20 Listing Requirements.
Projectors and enclosures for arc, xenon, and incandescent lamps and rectifiers, transformers, rheostats, and similar equipment shall be listed and labeled.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacturer remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Article 547 Agricultural Buildings, Structures and Premises

547.1 Scope.
The provisions of this article shall apply to the following agricultural buildings, structures, or that part of a building, structure, or adjacent areas of similar or like nature as specified in 547.1(A) or (B).

(A) Excessive Dust and Dust with Water.
Agricultural buildings or structures where excessive dust and dust with water may accumulate, including all areas of poultry, livestock, and fish confinement systems, where litter dust or feed dust, including mineral feed particles, may accumulate.

(B) Corrosive Atmosphere.
Agricultural buildings or structures where a corrosive atmosphere exists. Such buildings or structures include areas where the following conditions exist:

1. Poultry and animal excrement may cause corrosive vapors.
2. Corrosive particles may combine with water.
3. The area is damp and wet by reason of periodic washing for cleaning and sanitizing with water and cleansing agents.
4. Similar conditions exist.

547.2 Definitions.
**Distribution Point.**

An electrical supply point from which service drops, service conductors, feeders, or branch circuits to buildings or structures utilized under single management are supplied.

Informational Note No. 1: Distribution points are also known as the center yard pole, meterpole, or the common distribution point.

Informational Note No. 2: The service point as defined in Article 100 is typically at the distribution point.

**Equipotential Plane.**

An area where wire mesh or other conductive elements are embedded in or placed under concrete, bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to minimize voltage differences within the plane and between the planes, the grounded equipment, and the earth.

**Site-Isolating Device.**

A disconnecting means installed at the distribution point for the purposes of isolation, system maintenance, emergency disconnection, or connection of optional standby systems.

547.3 Other Articles.

For buildings and structures not having conditions as specified in 547.1, the electrical installations shall be made in accordance with the applicable articles in this Code.

547.4 Surface Temperatures.

Electrical equipment or devices installed in accordance with the provisions of this article shall be installed in a manner such that they will function at full rating without developing surface temperatures in excess of the specified normal safe operating range of the equipment or device.

547.5 Wiring Methods.

(A) Wiring Systems.

Types UF, NMC, copper SE cables, jacketed Type MC cable, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, or other cables or raceways suitable for the location, with approved termination fittings, shall be the wiring methods employed. The wiring methods of Article 502, Part II, shall be permitted for areas described in 547.1(A).

Informational Note: See 300.7, 352.44, and 355.44 for installation of raceway systems exposed to widely different temperatures.

(B) Mounting.

All cables shall be secured within 200 mm (8 in.) of each cabinet, box, or fitting. Nonmetallic boxes, fittings, conduit, and cables shall be permitted to be mounted directly to any building surface covered by this article without maintaining the 6 mm (¼ in.) airspace in accordance with 300.6(D).

(C) Equipment Enclosures, Boxes, Conduit Bodies, and Fittings.

(1) Excessive Dust.

Equipment enclosures, boxes, conduit bodies, and fittings installed in areas of buildings where excessive dust may be present shall be designed to minimize the entrance of dust and shall have no openings (such as holes for attachment screws) through which dust could enter the enclosure.

(2) Damp or Wet Locations.

In damp or wet locations, equipment enclosures, boxes, conduit bodies, and fittings shall be placed or equipped so as to prevent moisture from entering or accumulating within the enclosure, box, conduit body, or fitting. In wet locations, including normally dry or damp locations where surfaces are periodically washed or sprayed with water, boxes, conduit bodies, and fittings shall be listed for use in wet locations and equipment enclosures shall be weatherproof.

(3) Corrosive Atmosphere.

Where wet dust, excessive moisture, corrosive gases or vapors, or other corrosive conditions may be present, equipment enclosures, boxes, conduit bodies, and fittings shall have corrosion resistance properties suitable for the conditions.

Informational Note No. 1: See Table 110.28 for appropriate enclosure type designations.

Informational Note No. 2: Aluminum and magnetic ferrous materials may corrode in agricultural environments.

(D) Flexible Connections.

Where necessary to employ flexible connections, dusttight flexible connectors, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit, or flexible cord listed and identified for hard usage shall be used.

(E) Physical Protection.

All electrical wiring and equipment subject to physical damage shall be protected.

(F) Separate Equipment Grounding Conductor.

Where an equipment grounding conductor is installed underground within a location falling under the scope of Article 547, it shall be insulated.

Informational Note: For further information on aluminum and copper-clad aluminum conductors, see 250.120(B).
(G) Receptacles.

All 125-volt, single-phase, 15- and 20-ampere receptacles installed in the locations listed in (1) through (4) shall have ground-fault circuit-interrupter protection:

(1) Areas having an equipotential plane
(2) Outdoors
(3) Damp or wet locations
(4) Dirt confinement areas for livestock

547.6 Switches, Receptacles, Circuit Breakers, Controllers, and Fuses.

Switches, including pushbuttons, relays, and similar devices, receptacles, circuit breakers, controllers, and fuses, shall be provided with enclosures as specified in 547.5(C).

547.7 Motors.

Motors and other rotating electrical machinery shall be totally enclosed or designed so as to minimize the entrance of dust, moisture, or corrosive particles.

547.8 Luminaires.

Luminaires shall comply with 547.8(A) through (C).

(A) Minimize the Entrance of Dust.

Luminaires shall be installed to minimize the entrance of dust, foreign matter, moisture, and corrosive material.

(B) Exposed to Physical Damage.

Luminaires exposed to physical damage shall be protected by a suitable guard.

(C) Exposed to Water.

Luminaires exposed to water from condensation, building cleansing water, or solution shall be listed for use in wet locations.

547.9 Electrical Supply to Building(s) or Structure(s) from a Distribution Point.

A distribution point shall be permitted to supply any building or structure located on the same premises. The overhead electrical supply shall comply with 547.9(A) and (B), or with 547.9(C). The underground electrical supply shall comply with 547.9(C).

(A) Site-Isolating Device.

Site-isolating devices shall comply with 547.9(A)(1) through (A)(10).

(1) Where Required.

A site-isolating device shall be installed at the distribution point where two or more buildings or structures are supplied from the distribution point.

(2) Location.

The site-isolating device shall be pole-mounted and be not less than the height above grade required by 230.24 for the conductors it supplies.

(3) Operation.

The site-isolating device shall simultaneously disconnect all ungrounded service conductors from the premises wiring.

(4) Bonding Provisions.

The site-isolating device enclosure shall be connected to the grounded circuit conductor and the grounding electrode system.

(5) Grounding.

At the site-isolating device, the system grounded conductor shall be connected to a grounding electrode conductor.

(6) Rating.

The site-isolating device shall be rated for the calculated load as determined by Part V of Article 220.

(7) Overcurrent Protection.

The site-isolating device shall not be required to provide overcurrent protection.

(8) Accessibility.

The site-isolating device shall be capable of being remotely operated by an operating handle installed at a readily accessible location. The operating handle of the site-isolating device, when in its highest position, shall not be more than 2.0 m (6 ft 7 in.) above grade or a working platform.

(9) Series Devices.

An additional site-isolating device for the premises wiring system shall not be required where a site-isolating device meeting all applicable requirements of this section is provided by the serving utility as part of their service requirements.
(10) Marking.

A site-isolating device shall be permanently marked to identify it as a site-isolating device. This marking shall be located on the operating handle or immediately adjacent thereto.

(B) Service Disconnecting Means and Overcurrent Protection at the Building(s) or Structure(s).

Where the service disconnecting means and overcurrent protection are located at the building(s) or structure(s), the requirements of 547.9(B)(1) through (B)(3) shall apply.

(1) Conductor Sizing.

The supply conductors shall be sized in accordance with Part V of Article 220.

(2) Conductor Installation.

The supply conductors shall be installed in accordance with the requirements of Part II of Article 225.

(3) Grounding and Bonding.

For each building or structure, grounding and bonding of the supply conductors shall be in accordance with the requirements of 250.32, and the following conditions shall be met:

(1) The equipment grounding conductor is not smaller than the largest supply conductor if of the same material, or is adjusted in size in accordance with the equivalent size columns of Table 250.122 if of different materials.

(2) The equipment grounding conductor is connected to the grounded circuit conductor and the site-isolating device enclosure at the distribution point.

(C) Service Disconnecting Means and Overcurrent Protection at the Distribution Point.

Where the service disconnecting means and overcurrent protection for each set of feeders or branch circuits are located at the distribution point, the feeders or branch circuits to buildings or structures shall comply with the provisions of 250.32 and Article 225, Parts I and II.

Informational Note: Methods to reduce neutral-to-earth voltages in livestock facilities include supplying buildings or structures with 4-wire single-phase services, sizing 3-wire single-phase service and feeder conductors to limit voltage drop to 2 percent, and connecting loads line-to-line.

(D) Identification.

Where a site is supplied by more than one distribution point, a permanent plaque or directory shall be installed at each of these distribution points denoting the location of each of the other distribution points and the buildings or structures served by each.

547.10 Equipotential Planes and Bonding of Equipotential Planes.

The installation and bonding of equipotential planes shall comply with 547.10(A) and (B). For the purposes of this section, the term livestock shall not include poultry.

(A) Where Required.

Equipotential planes shall be installed where required in (A)(1) and (A)(2).

(1) Indoors.

Equipotential planes shall be installed in confinement areas with concrete floors where metallic equipment is located that may become energized and is accessible to livestock.

(2) Outdoors.

Equipotential planes shall be installed in concrete slabs where metallic equipment is located that may become energized and is accessible to livestock.

The equipotential plane shall encompass the area where the livestock stands while accessing metallic equipment that may become energized.

(B) Bonding.

Equipotential planes shall be connected to the electrical grounding system. The bonding conductor shall be solid copper, insulated, covered or bare, and not smaller than 8 AWG. The means of bonding to wire mesh or conductive elements shall be by pressure connectors or clamps of brass, copper, copper alloy, or an equally substantial approved means. Slatted floors that are supported by structures that are a part of an equipotential plane shall not require bonding.

Informational Note No. 1: Methods to establish equipotential planes are described in American Society of Agricultural and Biological Engineers (ASABE) EP473.2-2001, Equipotential Planes in Animal Containment Areas.

Informational Note No. 2: Methods for safe installation of livestock waterers are described in American Society of Agricultural and Biological Engineers (ASABE) EP342.3-2010, Safety for Electrically Heated Livestock Waterers.

Informational Note No. 3: Low grounding electrode system resistances may reduce voltage differences in livestock facilities.

Statement of Problem and Substantiation for Public Comment

This Comment on the Public Input is not necessarily intended to add clarity as the Panel Statement presumes. It is intended to add to the accuracy of the Article title and scope. Article 547 covers much more than is indicated in the present title and scope.
For example, 547.9 includes structures as well as buildings.  
547.2 defines the Site Isolation device. This obviously includes the site (premises) and is not limited to an agricultural building.  
547.10(A)(2) refers to outdoor areas, not only an agricultural building.

**Related Item**

Public Input No. 4345-NFPA 70-2014 [Article 547]

**Submitter Information Verification**

*Submitter Full Name:* Phil Simmons  
*Organization:* Simmons Electrical Services

**Committee Statement**

*Committee Action:* Rejected  
*Resolution:* CMP 19 recommends to Correlating Committee they make no change to the title. CMP 19 rejects the text change because the existing language adequately covers structures.
TITLE OF NEW CONTENT 547.5(H) Voltage Regulation. (New)

If a voltage range is provided by the equipment manufacturer, feeder and branch circuit conductors shall be sized to provide voltage at the equipment within the range that is required by the manufacturer. In addition, feeder and branch-circuit conductors shall be sized so the voltage at the end of the feeder conductor is not lower than 97% of that at the service or source and for branch circuits, not lower than 95% of that at the service or source at the furthest outlet. Calculations shall be based on circuit loading at 80 percent of the rating of the overcurrent device.

Statement of Problem and Substantiation for Public Comment

It is important for safe and proper operation that conductors be sized properly to provide voltage within the operating range as determined by the manufacturer. While some may opine that this is a requirement of 110.3(B), the rule is not obvious and stating the requirement here will help ensure safe and proper operation of equipment.

Submittal Date: Fri Sep 25 12:06:40 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: The informational notes in NEC Articles 210 and 215 address this issue and are consistent with NEC 90.1 (A) and (B) stating the NEC is not to be used as a design manual and the electrical system is not always adequate but safe.
Public Comment No. 1160-NFPA 70-2015 [Section No. 547.5(A)]

(A) Wiring Systems.

Types UF, NMC, copper SE cables, jacketed Type MC cable, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, or other cables or raceways suitable for the location, with approved termination fittings, shall be the wiring methods employed. The wiring methods of Article 502, Part II, shall be permitted for areas described in 547.1(A).

Informational Note: See 300.7, 352.44, and 355.44 for installation of raceway systems exposed to widely different temperatures.

Statement of Problem and Substantiation for Public Comment

The panel statement indicated that:
"There have been multiple instances in agricultural environments where wrapped outer conductor of the AL SE cable has corroded to failure within a foot or two of the connection."

Since only copper SE cable is currently allowed by the NEC, it is apparent that the observed failed installations were not code compliant. If they were not code compliant in the wiring method used, it is likely that they were non-code compliant in other installation details, leading to the observed failures. Both aluminum and copper conductors, when installed in accordance with the NEC, have proven to perform well in agricultural installations.

City:
State:
Zip:
Submittal Date: Wed Sep 23 23:00:09 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: There have been multiple instances in agricultural environments where AL SE cable has failed in a corrosive environment.
Public Comment No. 797-NFPA 70-2015 [Section No. 547.5(F)]

(F) Separate Equipment Grounding Conductor.
Where an equipment grounding conductor is installed underground within a location falling under the scope of Article 547, it shall be insulated and identified for the environment. The underground portion of the conductor shall not be spliced.

Informational Note: For further information on aluminum and copper-clad aluminum conductors, see 250.120(B).

Statement of Problem and Substantiation for Public Comment

It is critically important that the integrity of the equipment grounding conductor that is installed underground in Agricultural Buildings and/or structures where harsh and often corrosive conditions exist be maintained. The choice of the term "identified" is important to ensuring this safety. The word "identified" is defined in Article 100 and means "Recognizable as suitable for the specific purpose, function, use, environment, application, and so forth, where described in a particular Code requirement."

The proposed last sentence is also critical to safety of the installation of equipment grounding conductors that are installed underground under the Scope of Article 547. There are no wire splice insulation systems that are identified or listed for these harsh environments. This includes Sealed Wire-Connector Systems as no mention is made in the Guide Information for use of these systems in corrosive environments.

Submittal Date: Sun Sep 20 19:01:49 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: CMP 19 does not see the need to have specialized direct burial requirements for underneath agricultural environments. Conductors and splices identified for direct burial should be suitable for this application.
547.5(H) Voltage Regulation.
If a voltage range is provided by the equipment manufacturer, feeder and branch circuit conductors shall be sized to provide voltage at the equipment within the range that is required by the manufacturer. In addition, feeder and branch-circuit conductors shall be sized so the voltage at the end of the feeder conductor is not lower than 97% of that at the service or source and for branch circuits, not lower than 95% of that at the service or source at the furthest outlet. Calculations shall be based on circuit loading at 80 percent of the rating of the overcurrent device.

Statement of Problem and Substantiation for Public Comment
This Proposal and Comment must be accepted to provide an installation that has the practicable safeguards envisioned in 90.1(A) of the NEC. Proper sizing of the feeder and branch circuit conductors will help resolve the "tingle-voltage" problem that is so damaging to many agricultural buildings.

Committee Statement
Committee Action: Rejected
Resolution: The informational notes in NEC Articles 210 and 215 address this issue and are consistent with NEC 90.1 (A) and (B) stating the NEC is not to be used as a design manual and the electrical system is not always adequate but safe.
Manufactured Home.

A structure, transportable in one or more sections, which in the traveling mode is 2.4 m (8 ft) or more in width or 12.2 m (40 ft) or more in length, or when erected on site is 29.77 m² (320 ft²) or more. When not transportable, it is built on a permanent chassis and is designed to be used as a dwelling with or without a permanent foundation, whether or not connected to the utilities, and includes plumbing, heating, air conditioning, and electrical systems contained therein. The term manufactured home shall include any structure that meets all the requirements of this paragraph except the size requirements and with respect to which the manufacturer voluntarily files a certification required by the regulatory agency. Calculations used to determine the number of square meters (square feet) in a structure are based on the structure's exterior dimensions and include all expandable rooms, cabinets, and other projections containing interior space, but do not include bay windows [501:1.2.14]. For the purpose of this Code and unless otherwise indicated, the term mobile home includes manufactured homes and excludes park trailers defined in Article 552.4.

A structure, transportable in one or more sections, that, in the traveling mode, is 2.4 m (8 ft) or more in width or 12.2 m (40 ft) or more in length, or, when erected on site, is 29.7 m² (320 ft²) or more and that is built on a permanent chassis and is designed to be used as a dwelling, with or without a permanent foundation, whether or not connected to the utilities, and includes plumbing, heating, air conditioning, and electrical systems contained therein connected therein.

Informational Note No. 1: See the applicable building code for definition of the term permanent foundation.

Informational Note No. 2: See 24 CFR Part 3280, Manufactured Home Construction and Safety Standards, of the Federal Department of Housing and Urban Development, for additional information on the definition.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that the panel reconsider the definition of “Manufactured Home” in this first revision to comply with the NEC Style Manual. Additionally, the Correlating Committee directs the panel to revise the defined term to remove redundant text.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-5406-NFPA 70-2015
Statement: The definition is consistent with NFPA 501 (Standard on Manufactured Housing).
Public Comment No. 530-NFPA 70-2015 [Section No. 550.4(D)]

(550.6) Listed or Listed and Labeled.

All electrical materials, devices, appliances, fittings, and other equipment shall be listed or listed and labeled by a qualified testing agency and shall be connected in an approved manner when installed.

<th>Description</th>
</tr>
</thead>
</table>

Statement of Problem and Substantiation for Public Comment

The committee statement; “See Information Note to definition of “Listed” in Article 100. “Listed or Labeled” should remain,” informational notes are not enforceable.

Additionally, the committee did not address the renumbering of this section.

As stated previously in the PI, “or” gives an option, by stating “and” this provides the AHJ with language on how to determine if a product is actually listed. Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue. There are many instances where the AHJ is provided documentation in the absence of a label such as a Certificate of Compliance or a printed version of an online certification directory to establish that a product is listed.

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Resolution: SR-5414-NFPA 70-2015
Statement: The proposed changes add enforceability and clarity to the section.
Public Comment No. 273-NFPA 70-2015 [Section No. 550.13(G)]

(G) Receptacle Outlets Not Required.
Receptacle outlets shall not be required in the following locations:

1. In the wall space occupied by built-in kitchen or wardrobe cabinets
2. In the wall space behind doors that can be opened fully against a wall surface
3. In room dividers of the lattice type that are less than 2.5 m (8 ft) long, not solid, and within 150 mm (6 in.) of the floor
4. In the wall space afforded by bar-type counters

Statement of Problem and Substantiation for Public Comment

I feel that the receptacle spacing requirements found in Article 210 are relevant to this type of dwelling location. Thus, I would recommend removing list item (2) so that these spacing requirements are used during the layout of receptacles in these environments. It is typically the only receptacle that remains accessible for uses such as vacuuming due to the amount of furniture within these areas. Most receptacles in these areas end up behind furniture and makes it difficult for the homeowner to access.

(4) Units with 50-Ampere Power-Supply Assembly.

Recreational vehicles having a power-supply assembly rated 50 amperes as permitted by 551.42(D) shall have a 3-pole, 4-wire grounding-type attachment plug rated 50 amperes, 125/250 volts, listed or conforming to the configuration shown in Figure 551.46(C)(1).

Informational Note: Complete details of this configuration can be found in ANSI/NEMA WD 6-2002, Standard for Dimensions of Attachment Plugs and Receptacles, Figure 14.50.

Statement of Problem and Substantiation for Public Comment

As Kent Perkins stated in his Public Input, RV consumers are needing more and more service from their 120 V electrical system. This increase in service demands could also be addressed by allowing new technology and better systems to be implemented. In the most recent review cycle the committee responsible for NFPA 302 made changes intended to allow for cable connectors that do not meet current NEMA WD-6 designs. This change was intended to emphasize function and safety over configuration in shore power. To quote the Kim McCartney’s statement “There has been a tremendous advance in the safety of shore power cable connectors that do not meet current NFPA 70 designs for shore power cables. We tried to address the issue of fires in these inlet connectors at the last re-write of
NFPA 302 but there are still a significant number of boat fires resulting from the decades old terminal connections. The newer pin and plug smart plugs will prevent these fires.” We would like to reference this change when referring to all applications. It is in the best interest of the end user to provide safer products that are listed or labeled by a qualified testing agency, as is referenced in the newly revised NFPA 302 10.19.2.1.

Committee Statement
Committee Action: Rejected
Resolution: The current configurations in NFPA 70 Section 551.46 provide consistency and safety within the industry by standardizing connector configurations.
551.71 Type Receptacles Provided.

Every recreational vehicle site with electrical supply shall be equipped with recreational vehicle site supply equipment with at least one 20-ampere, 125-volt receptacle. A minimum of 20 percent of existing and 40 percent of all new recreational vehicle sites, with electrical supply, shall each be equipped with a 50-ampere, 125/250-volt receptacle conforming to the configuration as identified in Figure 551.46(C)(1). Every recreational vehicle site equipped with a 50-ampere receptacle shall also be equipped with a 30-ampere, 125-volt receptacle conforming to Figure 551.46(C)(1). These electrical supplies shall be permitted to include additional receptacles that have configurations in accordance with 551.81. A minimum of 70 percent of all recreational vehicle sites with electrical supply shall each be equipped with a 30-ampere, 125-volt receptacle conforming to Figure 551.46(C)(1). This supply shall be permitted to include additional receptacle configurations conforming to 551.81. The remainder of all recreational vehicle sites with electrical supply shall be equipped with one or more of the receptacle configurations conforming to 551.81. Dedicated tent sites with a 15- or 20-ampere electrical supply shall be permitted to be excluded when determining the percentage of recreational vehicle sites with 30- or 50-ampere receptacles.

Additional receptacles shall be permitted for the connection of electrical equipment outside the recreational vehicle within the recreational vehicle park.

All 125-volt, single-phase, 15- and 20-ampere receptacles shall have listed ground-fault circuit-interrupter protection for personnel. The GFCI devices used in RV site electrical equipment are not required to be weather or tamper resistant in accordance with 406.9 and 406.12.

Informational Note: The percentage of 50 ampere sites required by 551.71 may be inadequate for seasonal recreational vehicle sites serving a higher percentage of recreational vehicles with 50 ampere electrical systems. In that type of recreational vehicle park, the percentage of 50 ampere sites could approach 100 percent.

Statement of Problem and Substantiation for Public Comment

Remove confusion as to the intent of new 40% requirement. 40% was intended for only new construction sites

A minimum of 70 percent of all recreational vehicle sites with electrical supply shall each be equipped with a 30-ampere, 125-volt receptacle conforming to Figure 551.46(C)(1). This supply shall be permitted to include additional receptacle configurations conforming to 551.81. The remainder of all recreational vehicle sites with electrical supply shall be equipped with one or more of the receptacle configurations conforming to 551.81.

(D) Tent Sites. Dedicated tent sites with a 15- or 20-ampere electrical supply shall be permitted to be excluded when determining the percentage of recreational vehicle sites with 30- or 50-ampere receptacles.

(E) Additional Receptacles. Additional receptacles shall be permitted for the connection of electrical equipment outside the recreational vehicle within the recreational vehicle park.

(F) GFCI Protection. All 125-volt, single-phase, 15- and 20-ampere receptacles shall have listed ground-fault circuit-interrupter protection for personnel. The GFCI devices used in RV site electrical equipment are not required to be weather or tamper resistant in accordance with 406.9 and 406.12.

Informational Note: The percentage of 50 ampere sites required by 551.71 may be inadequate for seasonal recreational vehicle sites serving a higher percentage of recreational vehicles with 50 ampere electrical systems. In that type of recreational vehicle park, the percentage of 50 ampere sites could approach 100 percent.

Statement of Problem and Substantiation for Public Comment

It is difficult to understand the Panel's Statement. It is almost always an improvement in readability and usability to break up a long paragraph that contains multiple requirements into multiple paragraphs organized by rating of receptacle with titles. The Panel hopefully will recognize that there are no technical changes made in the PI or this Comment. The existing text has been cut and pasted into the list format with titles added.

Submitter Information Verification

Submitter Full Name: Phil Simmons
Organization: Simmons Electrical Services
Street Address:
City:
State:
Zip:
Submittal Date: Tue Sep 22 16:24:16 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-5408-NFPA 70-2015
Statement: CMP 19 re-formatted the text for readability. CMP 19 added language to clarify the of 40 percent requirement for new installations.
551.72 Distribution System.

(A) Systems.
Distribution systems shall provide the voltage and have a capacity for the receptacles provided in the recreational vehicle (RV) site supply equipment as calculated according to 551.73 and shall have an ampacity not less than 30 amperes. Systems permitted include 120 volts, 1-phase; 120/240 volts, 1-phase; and 120/208 volts, 1-phase.

(B) Three-Phase Systems.
Feeders from 208Y/120-volt, 3-phase systems shall be permitted to include two ungrounded conductors and shall include one grounded conductor and one equipment grounding conductor. So far as practicable, the loads shall be equally distributed on the 3-phase system.

(C) Receptacles.
Receptacles rated at 50 amperes shall be supplied from a branch circuit of the voltage class and rating of the receptacle. Other recreational vehicle sites with 125-volt, 20- and 30-ampere receptacles shall be permitted to be derived from any grounded distribution system that supplies 120-volt, single-phase power. The neutral conductors shall not be reduced in size below the size of the ungrounded conductors for the site distribution.

(D) Neutral Conductors.
Neutral conductors shall be permitted to be reduced in size below the minimum required size of the ungrounded conductors for 240-volt, line-to-line, permanently connected loads only.

Informational Note No. 1: Due to the long circuit lengths typical in most recreational vehicle parks, feeder conductor sizes found in the ampacity tables of Article 310 may be inadequate to maintain the voltage regulation suggested in 215.2(A)(1). The total circuit voltage drop is a sum of the voltage drops of each serial circuit segment, where the load for each segment is calculated using the load that segment sees and the demand factors shown in Table 551.73(A).

Informational Note No. 2: The requirements to size wire at 125 percent of maximum load of 210.19(A)(1) and 215.2(A)(1) (branch circuits and feeder circuits) do not apply to RV site supply circuits as they are not continuous loads.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that the panel reconsider FR 5412 to provide clarity. The term "branch circuit of the voltage class" is undefined in the NEC and may conflict with the new item (B). The requirement to prohibit neutral reduction may create confusion since the term "site distribution" is undefined.

The panel is also directed to revise the text of the informational notes to remove language that contains requirements accordance with the NEC Style Manual.

The Correlating Committee also recommends clarification of the phrases "serial circuit segment" and "calculated using the load that segment sees" in Informational Note No. 1.

Public Comment No. 850-NFPA 70-2015 [Section No. 551.73(B)]

(B) , Transformers and Secondary Panelboards.

For the purpose of this Code, where the park service exceeds 240 volts, transformers and secondary panelboards shall be treated as services.

Statement of Problem and Substantiation for Public Comment

The Panel Statement in response to the Public Input is incorrect. The definition of "Service" in NEC Article 100 states, "The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served." The service conductors terminate and end at the service disconnecting means.

Section 551.73(B) is incorrect for several reasons and should be deleted:
1. "For the purpose of this Code", Article 551 cannot apply to the entire Code only to the equipment and installations under the scope of Article 551.
2. "Where the park service exceeds 240 volts, transformers and secondary panelboards shall be treated as services." Take at the look at the definition of "Service" and "Service equipment" in Article 100.
3. Transformers and conductors on the load side of overcurrent protection are feeders as defined in Article 100.
4. Overcurrent protection for transformers is provided in Article 450, not by the serving utility as if the equipment is located on the supply side of the "Service Point".
5. Overcurrent protection rules for the conductors are in Article 240 as this is Premises Wiring as defined in Article 100.

Do us all a favor and delete this erroneous section!

Submittal Date: Mon Sep 21 13:12:15 EDT 2015

Committee Statement

Committee Action: Accepted
Resolution: SR-5409-NFPA 70-2015
Statement: CMP 19 agrees that these transformer secondary conductors and panelboards are not services.
551.74 Overcurrent Protection.

(A) Conductors. Overcurrent protection of conductors shall be provided in accordance with Article 240.

(B) Power Outlet Rating and Overcurrent Protection. All power outlets shall have a rating not less than the minimum feeder capacity required for the load calculated in accordance with Part VI of this Article. Power outlets shall be protected by an overcurrent protective device having a rating not greater than that of the power outlet. This overcurrent protective device shall be located within or at any point on the supply side of the power outlet.

Statement of Problem and Substantiation for Public Comment

Overcurrent protection of conductors is provided for in Article 240. However, overcurrent protection for power outlets is not provided in Article 240 or in Article 408. The Power Outlet includes internal bussing very similar to Panelboards. However there is no requirement in the NEC that the bussing in power outlets be protected within their current-carrying capability. This Public Input and Comment intend to "plug this hole". Without a doubt, if the Power Outlet were a panelboard, overcurrent protection is required. See 408.36. Surely, the Panel cannot expect us to believe that adding overcurrent protection ahead of a listed power outlet would in any way degrade the Listing of the product. Additional overcurrent protection on the supply side of the power outlet enhances safety. It is very common to see overcurrent protection rated at 200 to 250 amperes or greater ahead of the feeder that supplies power outlets that are rated at 100 amperes or less. This makes no sense from a safety standpoint. Again, if the power outlet were a panelboard, overcurrent protection within the rating of the panelboard would be required. Why not for power outlets?

City: 
State: 
Zip: 
Submittal Date: Tue Sep 22 15:58:41 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: CMP 19 recognizes there has been no history of problems with the current use of power outlets without additional feeder overcurrent protection.
551.80(C) Voltage Regulation. (New)

If a voltage range is provided by the equipment manufacturer, feeder and branch circuit conductors shall be sized to provide voltage at the equipment within the range that is required by the manufacturer. In addition, feeder and branch-circuit conductors shall be sized so the voltage at the end of the feeder conductor is not lower than 97% of that at the service or source and for branch circuits, not lower than 95% of that at the service or source at the furthest outlet. Calculations shall be based on circuit loading at 80 percent of the rating of the overcurrent device.

Statement of Problem and Substantiation for Public Comment

It is important for safe and proper operation that conductors be sized properly to provide voltage within the operating range as determined by the manufacturer. While some may opine that this is a requirement of 110.3(B), the rule is not obvious and stating the requirement here will help ensure safe and proper operation of equipment. It is very common for feeder conductors for RV Park electrical systems to be lengthy so it is important that the conductors be sized properly so the RV electrical systems will perform safely.

Method of Connecting Expandable Units.

The method of connecting expandable units to the main body of the park trailer shall comply with the following as applicable:

(1) Cord-and-Plug Connected.

Cord-and-plug connections shall comply with 552.48(O)(1) (a) through (O)(1)(d).

(1) (a) That portion of a branch circuit that is installed in an expandable unit shall be permitted to be connected to the portion of the branch circuit in the main body of the vehicle by means of an attachment plug and cord listed for hard usage. The cord and its connections shall comply with all provisions of Article 400 and shall be considered as a permitted use under 400.10. Where the attachment plug and cord are located within the park trailer’s interior, use of plastic thermoset or elastomer parallel cord Type SPT-3, SP-3, or SPE shall be permitted.

(2) (b) Where the receptacle provided for connection of the cord to the main circuit is located on the outside of the vehicle park trailer, it shall be protected with a ground-fault circuit interrupter for personnel and be listed for wet locations. A cord located on the outside of a park trailer shall be identified for outdoor use.

(3) (c) Unless removable or stored within the park trailer interior, the cord assembly shall have permanent provisions for protection against corrosion and mechanical damage while the park trailer is in transit.

(4) (d) The attachment plug and cord shall be installed so as not to permit exposed live attachment plug pins.

(2) Direct Wires Connected.

That portion of a branch circuit that is installed in an expandable unit shall be permitted to be connected to the portion of the branch circuit in the main body of the park trailer by means of flexible cord installed in accordance with 552.48(O)(2)(a) through (O)(2)(f) or other approved wiring method.

(1) (a) The flexible cord shall be listed for hard usage and for use in wet locations.

(2) (b) The flexible cord shall be permitted to be exposed on the underside of the vehicle.

(3) (c) The flexible cord shall be permitted to pass through the interior of a wall or floor assembly or both a maximum concealed length of 600 mm (24 in.) before terminating at an outlet or junction box.

(4) (d) Where concealed, the flexible cord shall be installed in nonflexible conduit or tubing that is continuous from the outlet or junction box inside the park trailer to a weatherproof outlet box, junction box, or strain relief fitting listed for use in wet locations that is located on the underside of the park trailer. The outer jacket of flexible cord shall be continuous into the outlet or junction box.

(5) (e) Where the flexible cord passes through the floor to an exposed area inside of the park trailer, it shall be protected by means of conduit and bushings or equivalent.

(6) (f) Where subject to physical damage, the flexible cord shall be protected with RMC, IMC, Schedule 80 PVC, reinforced thermosetting resin conduit (RTRC) listed for exposure to physical damage, or other approved means and shall extend at least 150 mm (6 in.) above the floor. A means shall be provided to secure the flexible cord where it enters the park trailer.

Statement of Problem and Substantiation for Public Comment

Numbered lists in 558.42(O)(1) and 558.42(O)(2) are changed to lettering per NFPA Style Guidelines. In 558.42(O)(1)(b), the term “park trailer” replaces “vehicle” for consistency in terminology throughout 552.48(O).

Public Comment No. 733-NFPA 70-2015 [ New Article after 555 ]

TITLE OF NEW CONTENT
555.xx(new) Precautionary Signage for recreational swimming in Marinas and Boatyards

Permanent safety signs shall be installed to give adequate notice of electrical shock hazard risks to persons using or swimming near a boat dock or marina. The signs shall be clearly visible from all approaches to a marina or boatyard facility. The signs shall state "WARNING - POTENTIAL WATER SHOCK HAZARD - SWIMMING IS DISCOURAGED"

Statement of Problem and Substantiation for Public Comment

The concept of precautionary signage proposed in PI-4565 and portions of PI-3248 should have been accepted by the Panel but with the wording now proposed for 555.xx(new). A complete prohibition of swimming in marinas and boatyards is beyond the scope of NFPA 70 but I believe precautionary signage to alert people in a marina or boatyard is within the scope of NFPA 70 and is a needed requirement to alert the public to a potential issue they may not even know exists.

Related Item
Public Input No. 4565-NFPA 70-2014 [New Article after 555]
Public Input No. 3248-NFPA 70-2014 [New Section after 555.3]

Submittal Date: Fri Sep 18 07:38:58 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-5411-NFPA 70-2015
Statement: The posting of signage will alert personnel coming into the vicinity of the potential for shock hazards. Numerous Electric Shock Drowning (including electrocution in the water) deaths and injuries have been documented and investigated over the last decade. In all cases these accidents would have been prevented if the victims did not swim in the water around boats and docks using AC electrical power.
555.1 Scope.

This article covers the installation of wiring and equipment in the areas comprising fixed or floating piers, wharves, docks, and other areas in marinas, boatyards, boat basins, boathouses, yacht clubs, boat condominiums, docking facilities associated with one-family dwellings, two-family dwellings, multifamily dwellings, and residential condominiums; any multiple docking facility or similar occupancies; and facilities that are used, or intended for use, for the purpose of repair, berthing, launching, storage, or fueling of small craft and the moorage of floating buildings.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee advises that article titles are the responsibility of the Correlating Committee and the Correlating Committee directs the panel to reconsider the title change for Article 555 (FR 5438). The title to Article 555 should be changed to recognize that these docking facilities are both commercial and non-commercial as noted in the Panel action on FR 5435 in 555.1.

Statement of Problem and Substantiation for Public Comment

As I understand it, the reason for moving to the 30ma max level is the recent NFPA Study "Assessment of Hazardous Voltage/Current in Marinas, Boatyards and Floating Buildings". The study (uploaded for this input) recommended the 30ma trip level at the point of service for the boats (the power pedestals). This is a conservative reduction of the maximum level of 100mA recommended by the 2008 USCG Study (also uploaded). The reasons for the ABYC recommendation were based on consistency with European standards, and that 30mA would be low enough not to create lethal gradients in the water around boats or docks with current leaks.

In reality, 100mA is also low enough to prevent lethal gradients as is documented in the USCG Study. No lethal gradients were detected when leakage levels below 100mA were evaluated. The leak rate used for most of the testing was 3 amps. The study confirmed the linear relationship of voltage, voltage gradients and currents allowing analysis to be based on the 3 amps of current physically introduced into the water for testing.

Using 30mA ground fault protection at the power pedestals (for the entire pedestal or for each receptacle overcurrent protection device) would provide adequate protection from dangerous voltage gradients. However, if this low level is extended to feeder breakers and main panel breakers, the cumulative small leakage from a number of boats could cause the entire dock or even entire marina to be deenergized when there may not be a dangerous condition present. This issue will be become magnified and significant in any saltwater application.

The main issue is in marina management. When the 30mA GFP for the main breaker trips, what is the marina operator to do? There will be no indication of which boat(s) caused the trips. There could be hundreds of boats to sort out, all without power until the leakage is found/corrected. It could be caused by 30 boats each leaking 1 mA into the water, none of which would present a danger to anyone in the water near the boat. Putting protection closest to the sources will enable quick sorting of the offending boats/pedestals allowing the majority of boats to maintain power. This will make ground fault protection "manageable" at marinas and boatyards.

The major drawback to exclusively protecting at the boat/pedestal is that there will be no protection for the wiring between the main service and the pedestal itself. More than half the accidents recorded on the Electric Shock Drowning List we maintain (uploaded) occurred upstream of the pedestal receptacle itself. Placing GFPs at the feeder panel and main breaker will provide the necessary protection for this section of the wiring.

Since 100mA was recommended in the USCG Study as the maximum GFP trip level, it would be wise to consider using this level as the trip point for feeders and main breakers in marinas ALONG WITH the GFP protection at the pedestal receptacles. This way all the wiring would be protected, and it would not be a management issue to find the source of any leaks causing trips. The other consideration with this strategy is the use of trip times to effect "selective tripping" of the breakers. In Selective Tripping, the breaker closest to the fault trips first, and the farthest trips last. This can be done with leakage trip settings however the trip times must be considered. For example, if a 1 amp leak develops on a boat, we would desire the pedestal breaker to trip before the main breaker, even though the trip levels of both are exceeded. This can be accomplished by analyzing the design criteria of protection devices selected for use.

The recommended change to 555.3 (30mA to 100mA) would significantly reduce the management burden associated with finding the leakage source if an operator chooses to install protection in the feeders or mains instead of at the pedestal. Installing 30mA protection at the feeders or mains will be unsustainable in a saltwater marina application. In our experience we have found that most all marinas have significantly more than 30mA cumulative leakage at any given time, especially those in saltwater.

Maintaining the level at 100mA would provide for safety, and at the same time improve the ability to manage faults throughout the marina. It allows the operators some flexibility as they seek the guidance of knowledgable industry personnel in the best selection for their marina applications.
Committee Statement

Committee Action: Rejected
Resolution: CMP 19 recognizes the 30mA ground-fault limit is consistent with that recommended in the Fire Protection Research Foundation report, “Assessment of Hazardous Voltage/Current in Marinas, Boatyards and Floating Buildings.”
TITLE OF NEW CONTENT  
(B) Voltage Regulation. (New)

Type your content here ...

(A) Maximum Voltage. Yard and pier distribution systems shall not exceed 1000 volts phase to phase.

If a voltage range is provided by the equipment manufacturer, feeder and branch circuit conductors shall be sized to provide voltage at the equipment within the range that is required by the manufacturer. In addition, feeder and branch-circuit conductors shall be sized so the voltage at the end of the feeder conductor is not lower than 97% of that at the service or source and for branch circuits, not lower than 95% at the furthest outlet of that at the service or source. Calculations shall be based on circuit loading at 80 percent of the rating of the overcurrent device.

Statement of Problem and Substantiation for Public Comment

The public deserves to have equipment that will provide reasonable operation for both safety and comfort. Where manufacturers are now worldwide it is important for safe and proper operation that conductors be sized properly to provide voltage within a standard operating range. When determined by the manufacturer, most offshore manufacturers have very low standards and would not require consideration for voltage minimums.

TITLE OF NEW CONTENT

555.24 Prohibition on Recreation Swimming in Marinas and Boatyards

(A) Recreation swimming shall be prohibited within the confines of marinas and boatyards. This includes areas around docks and other structures using AC power for any purpose (boats, dock services, lighting, etc.).

(B) Signs shall be posted to warn the public and facility personnel of the danger associated with swimming within the confines of a marina using AC power. These signs shall be visible from all approaches to a marina or boatyard facility. They shall be visible to the extent that they can be read before approaching within approx 25 yds of the marina. They shall include, at a minimum, the words “DANGER, NO SWIMMING, Electrical currents may present.”

(C) Precautions for water operations other than recreational (e.g., dock or boat maintenance) shall be taken to protect those engaging in such activities. These precautions shall be specified by the marina or boatyard operator and may include actions such as securing power to certain boats and docks and requiring protective equipment for workers (e.g., wetsuits, gloves).

(D) The marina or boatyard operator shall monitor and enforce the recreational swimming prohibition.

Statement of Problem and Substantiation for Public Comment

Swimming in marinas and boatyards presents a significant danger of Electric Shock Drowning (ESD) to people engaging in that activity. The just-released final NFPA study report (Assessment of Hazardous Voltage/Current in Marinas, Boatyard and Floating Buildings, November 5, 2014) stated:

“ABYC recommends that no recreational swimming at any time take place in a marina environment. Part of an effective plan against ESD will include a no swimming policy and “NO SWIMMING” signs posted throughout the facility. This will also prevent possible injury due to boat traffic, harmful marine life, etc.”

A prohibition on recreational swimming, along with appropriate danger/warning signage, would keep scores of people out of the water, significantly enhancing public safety.

It is recognized that in-water inspection and maintenance activities will still be required in marinas and boatyards. Professionals involved in these activities should be protected to the maximum extent feasible. Actions such as disconnecting shore connections to boats at and near the work location, securing power to docks or sections of docks, and wearing protective equipment (such as wet suits) can be used to provide adequate protection for maintenance personnel.

The general public does not have an understanding of the potential electrical dangers present within the confines of marinas and boatyards. Marina and boatyard operators clearly have a responsibility to provide protection from electrical hazards as is stated in NFPA 303:

“A.5.1 Electrical systems and electrical equipment in the marina and boatyard require special consideration because of the existence of some, or all, of the following conditions:

(5) Locations where electrical equipment and facilities are used by persons not under the control of the management, many of whom are unfamiliar with the possible hazards associated with such use and the means to avoid them — those persons need to be protected from electrical hazards when they are on the land, on boats, in storage.
Numerous Electric Shock Drowning (including electrocution in the water) deaths and injuries have been documented and investigated over the last decade. In all cases these accidents would have been prevented if the victims did not swim in the water around boats and docks using AC electrical power. A review of accidents, supported by recent in-water testing has shown that death and injury only occur in the immediate vicinity of the fault source (5-10 foot range). The latest Electric Shock Drowning List is attached.

Ground fault protection was added as 555.3 in the 2011 NEC. This safety enhancement should be viewed as protection for those who accidentally enter the water, and not as a "green light" for recreational swimming activities in marinas and boatyards.

Eliminating recreational swimming in the immediate vicinity of boats and docks using AC electrical power will protect the public against the dangers associated with using electrical power in marinas and boatyards. The warnings provided by signage, along with enforcement by marina and boatyard operators will save lives and prevent injuries to the public. Staying out of the water would have prevented ALL injuries and deaths from electricity to people swimming around docks and marinas.

Submittal Date: Fri Aug 28 11:23:10 EDT 2015

Committee Statement
Committee Action: Rejected but see related SR
Resolution: SR-5411-NFPA 70-2015
Statement: The posting of signage will alert personnel coming into the vicinity of the potential for shock hazards. Numerous Electric Shock Drowning (including electrocution in the water) deaths and injuries have been documented and investigated over the last decade. In all cases these accidents would have been prevented if the victims did not swim in the water around boats and docks using AC electrical power.
(G) Splices.

A box, conduit body, or other enclosure, with a cover installed, shall be required for all splices except where:

1. The circuit conductors being spliced are all from nonmetallic multiconductor cord or cable assemblies, provided that the equipment grounding continuity is maintained with or without the box.

2. The circuit conductors being spliced are all from metal sheathed cable assemblies terminated in listed fittings that mechanically secure the cable sheath to maintain effective electrical continuity.

Statement of Problem and Substantiation for Public Comment

The proposed revision is to clarify that 590.4(G)(1) applies only to splices of cord/cable assemblies that have a "nonmetallic" jacket. Clarity is needed.

Committee Statement
Committee Action: Rejected but see related SR
Resolution: SR-606-NFPA 70-2015
Statement: The addition of "nonmetallic" ensures that (1) applies to splices of multiconductor cords or cable assemblies with a nonmetallic jacket.
(J) Support.

Cable assemblies and flexible cords and cables shall be supported in place at intervals that ensure that they will be protected from physical damage. Support shall be in the form of staples, cable ties, straps, or similar type fittings installed so as not to cause damage. Cable assemblies and flexible cords and cables installed as branch circuits or feeders shall not be installed on the floor or on the ground. Extension cords shall not be required to comply with 590.4(J). Vegetation shall not be used for support of overhead spans of branch circuits or feeders.

Exception: For holiday lighting in accordance with 590.3(B), where the conductors or cables are arranged with strain relief devices, tension take-up devices, or other approved means to avoid damage from the movement of the live vegetation, trees shall be permitted to be used for support of overhead spans of branch-circuit conductors or cables.

Statement of Problem and Substantiation for Public Comment

590.4(J) prohibits flexible cords and cables from being laid on the floor or ground for temporary installations. Adequate support is needed to minimize the possibility of damage to the wiring method during its temporary period of use, and support and physical protection is appropriate for temporary wiring methods such as NM cable that are not rated for the rough service of a construction or demolition site. However, hard usage and extra-hard usage cables are manufactured to remain intact while laid on the ground or floor and used in rough service, and where so marked, in wet locations. Some hard usage and extra-hard usage cables are extremely large and heavy and are impractical to hang from cable ties, straps, or similar fittings. Attempting to support large cables above grade could also create a greater hazard by forcing the use of stanchions to suspend heavy cables across large construction or demolition sites, or placing long runs of large, high-ampacity cable in plastic cable protectors (Yellow Jacket®) where heat retention may be damaging to the cable’s insulation.

This proposal was previously rejected (ref Public Input No. 1981-NFPA 70-2014) with Committee Statement of “Section 590.2(A) states “except as specifically modified in this article, all other requirements of this Code for permanent wiring shall apply to temporary wiring installations.” Since extension cords, multiconductor cords, and multiconductor cables that are hard usage or extra hard usage are already permitted for this application, inclusion in 590.4(J) for these cords and cables are not necessary.”

A Technical Question was submitted to NFPA 9/15/2015, and Mark Cloutier NFPA Senior Electrical Engineer responded in part, “After discussions within our group the language in 590.2 is correct in that other requirements in the code apply unless amended by Article 590. However, the new language in 590.4(J) in the NEC 2014 clearly amends any permissive rules that in previous editions allowed the use of cords in the application you described and now prohibits flexible cords and cables installed as branch circuits and feeders from being installed on the floor or on the ground.” Mr. Cloutier’s response supports the position stated in Public Input No. 1981-NFPA 70-2014.

I respectfully resubmit a proposal to modify the language of 590.4(J) to reinstate the use of hard usage and extra-hard usage cables on the floor or ground in temporary installations.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-607-NFPA 70-2015
Statement: Multiconductor cords or cables that are identified in Table 400.4 for hard usage or extra hard usage shall not be required to comply with 590.4(J) as far as support is concerned. The extra text helps clarify what types of cords are acceptable for this temporary application.
Public Comment No. 615-NFPA 70-2015 [Section No. 590.6(B)]

(B) Use of Other Outlets.

For temporary wiring installations, receptacles, other than those covered by 590.6(A)(1) through (A)(3) used to supply temporary power to equipment used by personnel during construction, remodeling, maintenance, repair, or demolition of buildings, structures, or equipment, or similar activities, shall have protection in accordance with (B)(1) or (B)(2). When using (B)(1) or (B)(2) is not practical, the assured equipment grounding conductor program in accordance with (B)(3), or (B)(4) should be allowed.

(1) GFCI Protection.

Ground-fault circuit-interrupter protection for personnel.

(2) SP GFCI Protection.

Special purpose ground-fault circuit-interrupter protection for personnel.

(3) Assured Equipment Grounding Conductor Program.

A written assured equipment grounding conductor program continuously enforced at the site by one or more designated persons to ensure that equipment grounding conductors for all cord sets, receptacles that are not a part of the permanent wiring of the building or structure, and equipment connected by cord and plug are installed and maintained in accordance with the applicable requirements of 250.114, 250.138, 406.4(C), and 590.4(D).

(a) The following tests shall be performed on all cord sets, receptacles that are not part of the permanent wiring of the building or structure, and cord-and-plug-connected equipment required to be connected to an equipment grounding conductor:

(2) All equipment grounding conductors shall be tested for continuity and shall be electrically continuous.

(3) Each receptacle and attachment plug shall be tested for correct attachment of the equipment grounding conductor. The equipment grounding conductor shall be connected to its proper terminal.

(4) All required tests shall be performed as follows:

(5) Before first use on site

(6) When there is evidence of damage

(7) Before equipment is returned to service following any repairs

(8) At intervals not exceeding 3 months

(i) The tests required in item (2)(a) shall be recorded and made available to the authority having jurisdiction.

(4) EGFPD Protection.

Equipment ground-fault protective device.

Statement of Problem and Substantiation for Public Comment

Substantiation for including SPGFCI devices in the standard:

Fatality Statistics continue to show electrocutions as a significant cause of death at the work place. The 2015 NFPA 70E Standard, Annex K states that electrocutions are the fourth leading cause of industrial fatalities. It also stated that the National Safety Council estimates that about 1000 fatalities every year are due to electrocution, where more that 50% of them take place on system voltage less than 600 V. Moreover, approximately 30,000 non-fatal electrical shock accidents occur every year.

UL 943C identifies protective devices designated as special purpose GFCI (SPGFCI) and thus designed to meet the both NEC and NFPA 70E definition of devices intended for personnel protection. Updating the NEC to include SPGFCIs designed and approved for industrial applications per UL 943C holds the promise of significantly reducing loss of life at the work place.

During the first draft meeting, CMP 2 recognized SPGFCIs as a potential improvement to safety and created FR-339 and FR-347 to include a new definition for SPGFCIs and an installation requirement in Article 210.8(B) respectively.
Substantiation for including EGFPD devices in the standard:

Although EGFPDs are rated as equipment protection by UL, they are tested to both UL943 GFCI standard and UL 1053 Ground-Fault Sensing and Relaying Equipment. Therefore, EGFPD offer protection similar to GFCIs. EGFPDs should not be confused with ground-fault protection of equipment (GFPE). EGFPDs are equipped with a tripping mechanism similar to GFCIs and therefore are capable of interrupting power when a ground-fault is detected.

EGFPDs use the same GFCIs tripping characteristic and therefore an EGFPD will clear a ground-fault within the same clearing time of a GFCI provided that the fault-current magnitude is higher than the device set trip level. EGFPDs differ from GFCIs in:

1. Tripping level is adjustable in the range of 6 to 100 mA (GFCIs have a fixed trip level; 6 mA for Class A and 20 mA for Classes C, D, and E)
2. Monitoring equipment grounding conductor continuity is not required (a mandate for Classes C, D, and E GFCIs).

Unfortunately, some industrial systems have natural leakage current of more than 20 mA during normal operation. The submitter of this PI has experienced a leakage of more than 50 mA while testing an arc welder and a plasma cutter. A similar situation was encountered at a brick manufacture running 6 wet saws (concrete cutters) feed from one source. For those systems, the use of Classes C, D, or E GFCIs defined by UL 943C is impractical. Therefore, EGFPDs could be used to provide some protection to personnel when GFCIs cannot be used.

Although, some commercial EGFPDs are equipped with internal means to monitor equipment grounding conductor continuity, this feature is not available in all devices because it is not a required feature by UL for these devices. Therefore, in order to insure the grounding conductor continuity, a ground continuity monitor relay can be used in conjunction with EGFPDs.

600.1 Scope.

This article covers the installation of conductors, equipment, and field wiring for electric signs, outline lighting, and retrofit kits regardless of voltage. All installations, retrofit kits, and equipment using neon tubing, such as signs, decorative elements, skeleton tubing, or art forms, are covered by this article.

Informational Note: Sign and outline lighting illumination systems include, but are not limited to, cold cathode neon tubing, high-intensity discharge lamps (HID), fluorescent or incandescent lamps, light-emitting diodes (LEDs), and electroluminescent and inductance lighting.

Statement of Problem and Substantiation for Public Comment

The addition of Retrofit Kits is misplaced and out of context with the declaration that is intended to cover neon usage and installations. Re-positioned in the Scope Statement to harmonize with the statement that applies to field wiring.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacturer remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

**Committee Statement**

| Committee Action: | Rejected but see related SR |
| Resolution: | SR-5114-NFPA 70-2015 Removing the comma and adding and labeled with listing better clarifies the label is part of the listing and not some other label. |
| Statement: | The Panel agrees with public comment clarifying certain equipment be “listed and labeled” instead of just “listed.” Qualified Electrical Testing Laboratories do not consider a product to be listed unless the label has actually been applied. Additionally, the Article 100 definition for “labeled” includes the provision for labeling the smallest unit carton for parts which are too small to include the listing mark on the parts themselves. Labeling includes listing marks that are stamped or molded on or into the product. |
Public Comment No. 1465-NFPA 70-2015 [Section No. 600.4(B)]

(B) Retrofitted Signs and Outline Lighting Systems. Signs and outline lighting systems with a Retrofitted Illumination System.

- The retrofitted sign shall be marked that the illumination system has been replaced.
- The marking shall include the kit provider’s and installer’s name, logo, or unique identifier.

Signs equipped with tubular light-emitting diode lamps powered by the existing sign sockets shall require an additional warning label.

Retrofit illumination conversions shall be marked in a location visible during servicing in accordance with (1), (2), (3)

1. A permanent warning label that complies with 110.21(B) shall be applied to a retrofitted sign or outline lighting system:
   WARNING. RETROFIT KIT INSTALLED. REPLACE LAMPS AND POWER SOURCES WITH SAME TYPE AND RATING.

2. A permanent mark shall identify the retrofit kit installation company.

3. Other marks as required by the listed retrofit kit installation instructions or the authority having jurisdiction.

Statement of Problem and Substantiation for Public Comment

Revise for clarity and Code style for multiple requirements in a section. The marking instructions are vague and indeterminate.

1. A field applied hazard marking is required to be a label for compliance with 110.21(B). In the Code, text on cautionary labels is not unplanned or unspecific but rather it is uniform and specific to the hazard. e.g. 110.22(B)(C), 551.47, 700.7(B) This is for ease of recognition by different service personnel.

2. Omit “provider.” It is subjective and vague. Retrofit kits are required to be listed. (600.3) Qualified electrical testing laboratories that certify and list retrofit kits utilize a traceable marking that identifies the kit manufacturer making it an unnecessary duplication to require separate marking identifying the kit manufacturer for the AHJ. The installer of the kit needs to be identified since the installation company may not be the manufacturer of the retrofit kit or the listed host sign. This marking provides the AHJ with a means or identifying the installer of the field conversion. Secondly the marking identifying the installer provides the sign owner and future qualified service technicians access to a source for information about any special replacement parts and devices covered in the installation instructions for the original field conversion.

3. The additional requirement for marking T-LEDS is unnecessary because the warning label required in the revisions to (1) is sufficient in its scope to cover this safety issue. Revision for (3) apply to other markings that may be required in the installations for the listed kit conversion and additional marking required by the AHJ. For example, Washington's WAC 296-46B-600 requires a label with specific marking. "This label is in addition to any labeling required by the manufacturers installation instructions or the UL Standard used to manufacture the retrofit kit."

The reference to 110.21(B) will require the label to address the hazard with words and/or symbols as required. Additionally, the location of the required label is clarified.

Need to define what message warning label needs to convey, as well as where this label needs to be placed.
(3) Metal or Nonmetallic Sign Poles.

Metal or nonmetallic poles used to support signs shall be permitted to enclose supply conductors, provided the poles and conductors are installed in accordance with 410.30(B).

Statement of Problem and Substantiation for Public Comment

I agree with PI 2139... the panel state "The submitter has not provided a statement of problem to support a change in language" the reason for the change is to simplify the language for clarity.

Submittal Date: Fri Sep 18 21:02:53 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: Removing "metal or nonmetallic" does not provide clarity. Having "Metal and Nonmetallic" included in the section removes ambiguity regarding the application of the section and coordinates with 410.30(B).
(1) At Point of Entry to a Sign.

The disconnect shall be located at the point the feeder circuit or branch circuit(s) supplying a sign or outline lighting system enters a sign enclosure, a sign body, or a pole in accordance with 600.5(C)(3) and shall disconnect all ungrounded conductors where it enters the enclosure of the sign or pole.

Exception No. 1: A disconnect shall not be required for branch or feeder circuits passing through the sign where enclosed in a Chapter 3 listed raceway or metal-jacketed cable armored cable type AC or MC listed for the use.

Exception No. 2: A disconnect shall not be required at the point of entry to a sign enclosure or sign body for feeders or branch circuits that supply an internal panelboard(s) in a sign enclosure or sign body. The conductors shall be enclosed in a Chapter 3 listed raceway or metal-jacketed cable armored cable type AC or MC listed for the use. A field-applied permanent warning label that is visible during servicing shall be applied to the raceway at or near the point of entry into the sign enclosure or sign body. The warning label shall comply with 110.21(B) and state the following: "Danger. This raceway contains energized conductors. Do not open." The marking shall include the location of the disconnecting means for the energized feeders or branch circuit(s). The disconnecting means shall be capable of being locked in the open position in compliance with 110.25.

Statement of Problem and Substantiation for Public Comment

"Metal jacketed cable" is an ambiguous and inconsistent with Code terminology. In Code terms, cable with this physical characteristic is correctly identified in 320 and 330 as AC or MC armored cable. It is listed with specific conditions of use that comply with 320.10 and 330.10 and a robust alternative to Chapter 3 raceways. The proposed revision is for clarity, and consistency with Code terminology.

Committee Action: Rejected but see related SR
Resolution: SR-5127-NFPA 70-2015
Statement: The word circuit was replaced with conductor(s) after feeder for clarity in the first sentence and in the exceptions. The words "Do Not Open" were removed from the label for clarity.

The reference to specific cable types was changed to "metal-jacketed identified for the location" to accommodate the different environmental locations where a sign may be installed.
Public Comment No. 473-NFPA 70-2015 [Section No. 600.6(A)(1)]

(1) At Point of Entry to a Sign.

The disconnect shall be located at the point the feeder circuit or branch circuit(s) supplying a sign or outline lighting system enters a sign enclosure, a sign body, or a pole in accordance with 600.5(C)(3) and shall disconnect all ungrounded conductors where it enters the enclosure of the sign or pole.

Exception No. 1: A disconnect shall not be required for branch or feeder circuits passing through the sign where enclosed in a Chapter 3 listed raceway or metal-jacketed cable.

Exception No. 2: A disconnect shall not be required at the point of entry to a sign enclosure or sign body for feeders or branch circuits that supply an internal panelboard(s) in a sign enclosure or sign body. The conductors shall be enclosed in a Chapter 3 listed raceway or metal-jacketed cable. A field-applied permanent warning label that is visible during servicing shall be applied to the raceway or cable at or near the point of entry into the sign enclosure or sign body. The warning label shall comply with 110.21(B) and state the following: “Danger. This raceway or cable contains energized conductors. Do not open.” The marking shall include the location of the disconnecting means for the energized feeders or branch circuit(s). The disconnecting means shall be capable of being locked in the open position in compliance with 110.25.

Statement of Problem and Substantiation for Public Comment

Since a cable could be use, then the warning label needs to be on the cable as well. What does it mean ‘Do not open’ on the label? What is it that you can open in the raceway or cable. Maybe this exception needs to be revised to achieve the panels intent.

Statement of Problem and Substantiation for Public Comment

eliminating the first "circuit" is consistent with the rest of the sections and there could be more than one. Jacketed should be changed to either armored or sheathed to be consistent with the NEC language.

Resolution: SR-5127-NFPA 70-2015
Statement: The word circuit was replaced with conductor(s) after feeder for clarity in the first sentence and in the exceptions. The words “Do Not Open” were removed from the label for clarity.

The reference to specific cable types was changed to “metal-jacketed identified for the location” to accommodate the different environmental locations where a sign may be installed.
Public Comment No. 1669-NFPA 70-2015 [Section No. 600.6(A)(3)]

(3) Within Sight of the Controller.

The following shall apply for signs or outline lighting systems operated by electronic or electromechanical controllers located external to the sign or outline lighting system:

1. The disconnecting means shall be located within sight of the controller or in the same enclosure with the controller.
2. The disconnecting means shall disconnect the sign or outline lighting system and the controller from all ungrounded supply conductors.
3. The disconnecting means shall be designed such that no pole can be operated independently and shall be lockable in accordance with 110.25.

Exception: Where the disconnecting means is not located within sight of the controller, a permanent field-applied marking identifying the location of the disconnecting means shall be applied to the controller in a location visible during servicing. The warning label shall comply with 110.21(B).

Informational Note: The intention of the point of entry into a sign enclosure, sign body or pole is intended to allow the service or maintenance personnel complete and local control of the disconnecting means. This also allows local "Lock/Out Tag/Out" without a search of a electrical system, whether remote or local.

Statement of Problem and Substantiation for Public Comment

The informational note may clarify the intent of the safety of the location and rational for the means to be local and available.

Submittal Date: Fri Sep 25 16:07:01 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-5126-NFPA 70-2015
Statement: The new informational note and existing text is properly located in the parent text of 600.6 to provide the code user with information related to revisions in First Revision No. 5137.

Editorially, "circuit" is revised to "conductor" for clarity.
(C) Class 2.

Where the installation complies with 600.33 and the power source provides a Class 2 output that complies with 600.24, either of the following wiring methods shall be permitted as determined by the installation instructions and conditions.

(1) Wiring methods identified in Chapter 3
(2) Class 2 cables complying with Part III of Article 725, Table 600.33(A)(1) and Table 600.33(A)(2).

Statement of Problem and Substantiation for Public Comment

CMP 18 has accepted the premise that references to 725 be deleted from 600. Power limited cable requirements have been moved to 600.33 and incorporated into Table 600.33(A)(1) and (A)(2). The text revision is required in 600.12(C)(2) as part of this realignment.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing and labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Resolution: SR-5125-NFPA 70-2015
Statement: Inadvertently left reference to Article 725 in First Draft, this action removes the references.

This action should satisfy the Correlating Committee recommendation in PC# 1827
Public Comment No. 1325-NFPA 70-2015 [Section No. 600.33(A) [Excluding any Sub-Sections]]

Listed. Class 2 cable listed for the application that complies with Table 600.33(A)(1), and or Substitution Table (A)(2) shall be installed on the load side of the Class 2 power source. The conductors shall have an ampacity not less than the load to be supplied and shall not be sized smaller than 18 AWG.

Statement of Problem and Substantiation for Public Comment

600.33(A) Revisions.
The wide range of Class 2 cable types are each certified and listed for specific applications as identified by markings on the cable, PLTC as an example, is described in UL's "General Information For Electrical Equipment the White Book", under Power Limited Cable (QPTZ) as being suitable for direct burial in the earth WHEN MARKED DIRECT BURIAL. Similarly it is sunlight resistant WHEN MARKED SUNLIGHT RESISTANT. The change in the syntax in 600.33(A) clearly informs the Code user that the cable must not only be listed, but listed for the application as described on Table 600.33(A)(1) which is positioned directly below under the caption "Applications of Power Limited Cable in Signs and Outline Lighting".

Table 600.33(A)(1) Revisions.
Amend subtitle in Column 1, Row 1 to identify the group of Class 2 cables that are acceptable for common use in secondary Class 2 sign circuits inside buildings. (Reference Table 725.154, 725.136(K))
Amend subtitle in Column 1, Row 2 to identify group of Class 2 cables that are acceptable for use in secondary Class 2 sign circuits in risers and vertical runs. (Reference Table 725.154, 725.135(D)(1))
Amend subtitle in Column 1, Row 3 to identify the group of Class 2 cables that are suitable for secondary Class 2 sign circuits in environmental air spaces and ducts. (Reference Table 725.154, &25 135(B)(1),(C)(1))

The changes improve the usability of the table, readily matching the installation application with suitable Class 2 Cable types.

Statement of Problem and Substantiation for Public Comment

There is no justification to require higher gauge wire for the signs while 22 AWG wire is permitted elsewhere in the standard to power other products. As long as wire gauge is sufficient to handle the load it should be permissible. With the growing demand for PoE it makes no sense to place these restrictions. To my knowledge there are no 18AWG Ethernet cables, and in fact some go down as small as 26AWG. Why should the sign lighting be different? 840.160 Powering Circuits goes all the way down to 26AWG and provides new Table 840.160 (A) with ampacity ratings.

Submitter Information Verification

Submitter Full Name: DON MILETICH
Organization: CREE INC

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-5124-NFPA 70-2015 Retain the 18 AWG because 26 AWG conductor size is not suitable for the ampacity used in signs and due to the voltage drop in the application or the LED and drivers the 18 gauge is specified from the wire manufactures. It also exists in field wiring in UL 48 as the minimum conductor size. Changing the language of "location" would not improve the clarity for the AHJ.
Statement: Made multiple editorial revisions to improve clarity and usability.

(1) - General Use.
CL2 or CL3, PLTC, or any listed applicable cable for general use shall be installed within and on buildings or structures.

(2) - Other Building Locations.
In other locations, any listed applicable cable permitted in 600.33(A)(1), (A)(2), (A)(3), and (A)(4) and Table 600.33(A)(1) and (A)(2) shall be permitted to be used as follows:
   (1) CL2P or CL3P — Ducts, plenums, or other spaces used for environmental air
   (2) CL2R or CL3R — Vertical shafts and risers
   (3) Substitutions from Table 600.33(A)(1)

Statement of Problem and Substantiation for Public Comment

Delete subsections 600.33(A)(1),(2),(3),(4)
The purpose of the revision to 600.33 was ostensibly to simplify the identity of permitted types of Class 2 power limited cable in secondary Class 2 sign circuits. The creation of Table 600.33(A)(1) and Substitution Table (A)(2) is intended to provide the Code user and the AHJ with easily recognizable Class 2 cable for environments common to sign installations. The repetition in (A)(1-4) does not contribute to that goal but adds confusion selecting the permitted cable for the installation application. For example, the subtitles on Table 600.33(A)(1) do not harmonize with the subsection titles GENERAL USE (A)(1) or OTHER BUILDING LOCATIONS (A)(2). The tables by themselves achieve the objective of bringing into Article 600 the identity of permitted Class 2 cable types from 725 for easy selection by the installer and AHJ approval.

Committee Action: Rejected
Resolution: There is no confusion in selecting wire size. Submitter did not provide adequate substantiation for revision.
Public Comment No. 1364-NFPA 70-2015 [Section No. 600.33(B)]

(B) Installation.
Secondary wiring shall be installed in accordance with (B)(1) and (B)(2).

(1) Support wiring. Wiring shall be installed and supported in a neat and workmanlike manner. Cables and conductors installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable is not damaged by normal building use. The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft). Such cables shall be supported by straps, staples, hangers, cable ties, or similar fittings designed and installed so as not to damage the cable. The installation shall also comply with 300.4(D).

(2) Connections in cable and conductors shall be made with listed insulating devices and be accessible after installation. Where made in a wall, connections shall be enclosed in a listed box.

Statement of Problem and Substantiation for Public Comment

Syntax correction required to clearly convey intended intent of this subsection which is describing the manner in which secondary wiring is to be supported on the building.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

</thead>
<tbody>
<tr>
<td>CMAA_substitution_of_NEC_310_16_vs_610_14-R2.xlsx</td>
<td>CMAA substantiation of 2.25 multiplier allowance in 610.14F.</td>
<td></td>
</tr>
</tbody>
</table>

Statement of Problem and Substantiation for Public Comment

Multiplying continuous loads by the 2.25 factor allows for ease of utilizing Table 610.14(A) which is for use with short-time rated crane and hoist motors to also be used for continuous loads on cranes. This is also in alignment with what the industry is doing based on CMAA (Crane Manufacturer’s Association of America) interpretation of this section of the Code.

The resubmitted public comment includes CMAA submitted substantiation showing that this 2.25 multiplier is a reliable substitution in order to use Table 610.14(A) for continuous use conductors instead of NEC 310.16.

State:
Zip:
Submittal Date: Mon Sep 21 14:39:08 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: The suggested revision does not add any clarity to the code. It still refers the reader to the appropriate sections of the code. The CMAA's use of a single multiplier of 2.25 as a simplified approach to utilize the short time rated ampacity table for the continuous duty loads should not negate the use of the appropriate sections of the code for continuous duty loads.
620.1 Scope.
This article covers the installation of electrical equipment and wiring used in connection with elevators, dumbwaiters, escalators, moving walks, platform lifts, and stairway chairlifts.

Informational Note No. 1: For further information, see ASME A17.1-2013 /CSA B44-13, Safety Code for Elevators and Escalators.

Informational Note No. 2: For further information, see CSA B44.1-14 /ASME-A17.5-2014, Elevator and Escalator Electrical Equipment Certification Standard.

Informational Note No. 3: The term wheelchair lift has been changed to platform lift. For further information, see ASME A18.1-2008 2014, Safety Standard for Platform Lifts and Stairway Lifts, Chairlifts.

Organization: [ Not Specified ]
Street Address:
City:
State:
Zip:
Submittal Date: Wed Jul 01 01:31:37 EDT 2015

Committee Statement

Committee Action: Accepted
Resolution: SR-3327-NFPA 70-2015
Statement: This change updates the referenced standards to the latest editions.
(B) Guards.

Live parts of the electrical equipment are suitably guarded to the requirements of 110.27(A), isolated, or insulated, so as to remove the likelihood of inadvertent contact between a qualified person in the working space and live voltage greater than 30 volts rms, 42 volts peak, or 60 volts dc and the equipment can be examined, adjusted, serviced, or maintained while energized without removal of this protection.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that this First Revision be rewritten to provide additional clarity and usability.

Submittal Date: Tue Sep 29 10:26:43 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3328-NFPA 70-2015
Statement: The submitter of the Public Input No. 2885 wanted to reference 110.27(A) to help clarify the term “suitable guarded”. Referencing 110.27(A) does not accomplish that intent.

Section 110.27(A) addresses Live Parts Guarded Against Accidental Contact and providing isolation by location, partitions or screens, and elevation NOT isolated, or insulated for working clearances as addressed in 620.5(B). The removal of “to the requirements of 110.27(A)” eliminates the conflict.

Also, the removal of “so as”, “between a qualified person in the working space and” and the addition of “with”, “parts operating at” and the “s” after voltage provide additional clarity and usability per the request of the Correlating Committee.
The insulation of conductors shall comply with 620.11(A) through (D).

Informational Note: One method of determining that the insulation of conductors is flame retardant is by testing the conductors or cables to the VW-1 (Vertical-Wire) Flame Test in ANSI/UL 1581-2011, Reference Standard for Electrical Wires, Cables, and Flexible Cords.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that further consideration be given to the comments expressed in voting on FR 3330. The Correlating Committee directs Panel 12 clarify the use of the phrase "for that purpose."

Submittal Date: Tue Sep 29 10:41:41 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3329-NFPA 70-2015
Statement: Replaces the phrase "for that purpose" with language to provide better clarity. The first sentence is retained as its deletion would increase the scope of the requirement
Statement of Problem and Substantiation for Public Comment

The public deserves to have equipment that will provide reasonable operation for both safety and comfort. Where manufacturers are now worldwide it is important for safe and proper operation that conductors be sized properly to provide voltage within a standard operating range. When determined by the manufacturer, many offshore manufacturers have very low standards and would not require consideration for voltage minimums. The time has come to elevate this issue parallel to it’s real importance.

Submitter Information Verification

Submitter Full Name: TRAVIS LINDSEY
Organization: TLC SERVICES
Street Address: 
City: 
State: 
Zip: 
Submittal Date: Fri Sep 25 11:05:45 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: NEC section 110.3 addresses installation and use of equipment and 110.4 states that the voltage considered shall be that at which the circuit operates. The NEC is not a design document.
(A) Conductors Supplying Single Motor.

Conductors supplying a single motor shall have an ampacity not less than the percentage of motor nameplate current determined from 430.22(A) and (E).

Informational Note: Some elevator motor currents, or those motor currents of similar function, exceed the motor nameplate value. Heating of the motor and conductors is dependent on the root-mean-square (rms) current value and the length of operation time. Because this motor application is inherently intermittent duty, conductors are sized for duty cycle service as shown in Table 430.22(E).

(B) Voltage Regulation.

If a voltage range is provided by the equipment manufacturer, feeder and branch circuit conductors shall be sized to provide voltage at the equipment within the range that is required by the manufacturer. In addition, feeder and branch-circuit conductors shall be sized so the voltage at the end of the feeder conductor is not lower than 97% of that at the service or source and for branch circuits, not lower than 95% of the voltage at the service or source at the furthest outlet. Calculations shall be based on circuit loading at 80 percent of the rating of the overcurrent device.

Statement of Problem and Substantiation for Public Comment

It is important for safe and proper operation that conductors be sized properly to provide voltage within the operating range as determined by the manufacturer. It is very common for feeder conductors for elevators, escalators, and similar equipment to be lengthy so it is important that the conductors be sized properly so the electrical systems will perform safely.

Committee Statement

Committee Action: Rejected
Resolution: NEC section 110.3 addresses installation and use of equipment and 110.4 states that the voltage considered shall be that at which the circuit operates (under load). The addition of this new section is redundant.
(A) Marking.

Where an elevator control panel is utilized, it shall be marked with its short-circuit current rating, based on one of the following:

(1) Short-circuit current rating of a listed assembly
(2) Short-circuit current rating established utilizing an approved method

Informational Note: UL 508A-2013, Supplement SB, is an example of an approved method.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs the panel to reconsider the use of the word "utilized.

</table>
620.22 Branch Circuits for Car Lighting, Receptacle(s), Ventilation, Heating, and Air-Conditioning.

(A) Car Light Source.
An individual branch circuit shall supply the car lights, receptacle(s), auxiliary lighting power source, and ventilation on each elevator car. The overcurrent device protecting the branch circuit shall be located in the elevator machine room or control room/machinery space or control space.
Required lighting shall not be connected to the load side of a ground-fault circuit interrupter.

(B) Air-Conditioning and Heating Source.
An individual branch circuit shall supply the air-conditioning and heating units on each elevator car. The overcurrent device protecting the branch circuit shall be located in the elevator machine room or control room/machinery space or control space.

Statement of Problem and Substantiation for Public Comment

The point is, these two sections use a term "A separate branch circuit" is not defined in Article 100, or in Article 620 for that matter. So, this phrase is subject to varying interpretations.
The term "individual" is defined in Article 100 and should be used.

Submittal Date: Tue Sep 22 18:00:05 EDT 2015

Committee Statement
Committee Action: Rejected
Resolution: "Individual branch circuit" is defined in the NEC in Article 100: Branch Circuit, Individual. A branch circuit that supplies only one utilization equipment. The term "separate" is common language and does not require an NEC definition.
620.23 Branch Circuits for Machine Room or Control Room/Machinery Space or Control Space Lighting and Receptacle(s).

(A) Separate Branch Circuit.
Separate branch circuit(s) shall supply the machine room or control room/machinery space or control space lighting and receptacle(s).
Required lighting shall not be connected to the load side of a ground-fault circuit interrupter.

(B) Lighting Switch.
The machine room or control room/machinery space or control space lighting switch shall be located at the point of entry.

(C) Duplex Receptacle.
At least one 125-volt, single-phase, 15- or 20-ampere duplex receptacle shall be provided in each machine room or control room and machinery space or control space.

Informational Note: See ASME A17.1-2010/CSA B44-10, Safety Code for Elevators and Escalators, for illumination levels.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that further consideration be given to the comments expressed in voting on FR 3386.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3331-NFPA 70-2015
Statement: Panel 12 has changed the title of section 620.23(A) plural and relocated "the lighting and receptacle(s)" to add clarity to the rule and to clarify the intent of FR 3386 per the request of the Correlating Committee. The Panel action also updates the referenced standards to the most recent edition.
Public Comment No. 1260-NFPA 70-2015 [Section No. 620.23(A)]

(A)  

Separate Branch Circuit Circuits.  

Separate  

The branch circuit(s) shall supply  
supplying the  

machine room or control room/machinery space or control space lighting and  

lighting of any machine rooms, control rooms, machinery spaces, or control spaces shall be separate  

from the branch circuit(s) supplying the receptacle(s)  

Required lighting shall not be connected to the load side of a ground-fault circuit interrupter  
in those places. All these circuits shall supply no other loads.  

Statement of Problem and Substantiation for Public Comment

Revise the text as recommended by Scott Cline in his affirmative ballot comment as follows:
The FR wording is an improvement, but the Title needs to have “Circuit” made plural, AND I think it still does not solve the problem of ambiguity. It could  

still be interpreted correctly but unintentionally that one circuit could supply both lighting and receptacles, just as long as it was a circuit  

separate from all  

lighting and receptacles outside the listed places.

Submittal Date: Thu Jun 25 19:26:58 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3332-NFPA 70-2015
Statement: This change complies with the request of the Correlating Committee to clarify the intent of First Revision No. 3387. This rule requires at least two circuits, and so the parenthetic (s) in "circuit(s)" is incorrect. This change also updates the referenced standards to the most recent edition.
(A) Type.

The disconnecting means shall be an enclosed externally operable fused motor circuit switch or circuit breaker that is lockable open in accordance with 110.25.

The disconnecting means shall be a listed device.

Informational Note: For additional information, see ASME A17.1-2013/CSA B44-13, Safety Code for Elevators and Escalators.

Exception No. 1: Where an individual branch circuit supplies a platform lift, the disconnecting means required by 620.51(C)(4) shall be permitted to comply with 430.109(C). This disconnecting means shall be listed and shall be lockable open in accordance with 110.25.

Exception No. 2: Where an individual branch circuit supplies a stairway chairlift, the stairway chairlift shall be permitted to be cord-and-plug-connected, provided it complies with 422.16(A) and the cord does not exceed 1.8 m (6 ft) in length.

Statement of Problem and Substantiation for Public Comment

Committee Statement

Committee Action: Accepted
Resolution: SR-3333-NFPA 70-2015
Statement: Updated to latest reference standard names and editions.
(2) Available Short-Circuit Current Field Marking.
Where an elevator control panel is used, it shall be legibly marked in the field with the maximum available short-circuit current. The field marking(s) shall include the date the short-circuit current calculation was performed and be of sufficient durability to withstand the environment involved.

When modifications to the electrical installation occur that affect the maximum available short-circuit current at the elevator control panel, the maximum available short-circuit current shall be verified or recalculated as necessary to ensure the elevator control panel’s short-circuit current rating is sufficient for the maximum available short-circuit current at the line terminals of the equipment. The required field marking(s) shall be adjusted to reflect the new level of maximum available short-circuit current.

Statement of Problem and Substantiation for Public Comment

IEC’s position is to delete 620.51(D)(2) - (FR 3393)

The code already requires that equipment be installed according to available fault current, so adding this requirement is redundant. The installer/supplier already has the responsibility/liability to install the proper equipment based on the characteristics of the system. This proposal puts too much liability on the contractor/supplier because after installation various factors can change which will affect the available fault current. Feeders can be reworked, transformers can be changed with different impedance values, motor loads can be added to the existing system and similar factors that can change the available fault current. In the case of a lawsuit, the installer will have the burden of proof that the installation was done according to code and would result in unnecessary costs for defending an installation that was installed correctly, but that had variables change that are out of their control. A better proposal would be to require the owner to relabel the equipment after any alteration to the system.

Submittal Date: Fri Sep 18 20:29:55 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: The committee reaffirms that marking of the available short-circuit current and its date of calculation will increase safety. It will create safer installations by adding language to assist the installer and the Authority Having Jurisdiction (AHJ).
Surge Protection.

Where any of the disconnecting means in 620.51 has been designated as supplying an emergency or a standby system load, surge protection shall be provided.

Informational note: See 700.8 for surge protection required for emergency systems.

Statement of Problem and Substantiation for Public Comment

In accordance with section 620.91 elevators can be powered by an emergency or standby system. Section 700.8 has the requirement for surge protection for emergency systems; however, there is no requirement for surge protection in Article 701 for legally required standby systems nor is the requirement in Article 702 for optional standby systems. The proposed reworded text provides clarity.

Submitter Full Name: ROBERT JONES
Organization: IEC Texas Gulf Coast
Street Address:
City:
State:
Zip:
Submittal Date: Sun Sep 20 18:31:20 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: The intent of First Revision No. 3395 was to provide a requirement for surge protection on elevator disconnects for systems that are designated as emergency loads. This aligns with 700.8, requiring surge suppression on emergency system switchboards and panelboards, but not on legally required standby system and optional standby system switchboards and panelboards.
An elevator(s) shall be permitted to be powered by an emergency or standby power system.

Informational Note: See ASME A17.1-2010 /CSA B44-10, Safety Code for Elevators and Escalators, 2.27.2, for additional information.

625.1 Scope.

This article covers the electrical conductors and equipment external to an electric vehicle that connect an electric vehicle to a supply of electricity by conductive, inductive, or wireless power transfer (contactless inductive charging) means, and the installation of equipment and devices related to electric vehicle charging.

Informational Note No. 1: For industrial trucks, see NFPA 505-2013, Fire Safety Standard for Powered Industrial Trucks Including Type Designations, Areas of Use, Conversions, Maintenance, and Operation.

Informational Note No. 2: UL 2594-2013, Standard for Electric Vehicle Supply Equipment, is a safety standard for conductive electric vehicle supply equipment. UL 2202-2009, Standard for Electric Vehicle Charging System Equipment, is a safety standard for conductive electric vehicle charging equipment.

Informational Note No. 3: UL 2750, Wireless Charging Equipment for Electric Vehicles.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs the panel to provide further explanatory text in Informational Note 3.

<td>An EVSE intended for indoor or outdoor use that can be carried from charging location to location and is transported in the vehicle when not in use. This type of cord set will device may be subject to changing environmental conditions.</td>
</tr>
</tbody>
</table>

**Statement of Problem and Substantiation for Public Comment**

Not all portable EVSE are cord sets. Changing "will" to "may" improves the clarity of the proposal as the environmental conditions for portable EVSE may not always change.

**Public Comment No. 1833-NFPA 70-2015 [Definition: Portable.]**

**625.2 Portable.**
An EVSE intended for indoor or outdoor use that can be carried from charging location to location and is transported in the vehicle when not in use. This type of cord set will be subject to changing environmental conditions.

**Statement of Problem and Substantiation for Public Comment**

The Correlating Committee notes that there are proposed definitions for "portable" in 625.2 and "portable equipment" in Article 100. The Correlating Committee directs Panel 12 to review both proposed definitions. The Correlating Committee also directs the panel to consider the context of the use of the word "portable" throughout Article 625.

Statement: This revision clarifies this definition of portable as applying only to EVSE as there are other definitions for portable in the Code. The last sentence was deleted as it does not relate to portability.
Wireless Power Transfer Equipment (WPTE).

Equipment consisting of a charger power converter and a primary pad. The two devices are either of the following:

- Interconnected by an output cable or suitable conduit system
- Contained within a single enclosure without an output cable or other suitable wiring means

Statement of Problem and Substantiation for Public Comment

The deleted text simplifies and clarifies the definition. The mention of a cable in wireless power transfer equipment seems confusing. Also, it is not clear what is meant by "suitable conduit system" and "suitable wiring means."

Public Comment No. 1455-NFPA 70-2015 [Definitions (625.2): Fastened in... to Fixed in Pl...]

Definitions (625.2): Fastened in... to Fixed in Pl...

**Fastened in Place.**

Mounting means of an EVSE in which the fastening means are specifically designed to permit periodic removal for relocation, interchangeability, maintenance, or repair without the use of a tool.

**Fixed in Place.**

Mounting means of an EVSE permanently attached to a wall, surface or surface mounting means with fasteners that require a tool to be removed remove the EVSE.

Statement of Problem and Substantiation for Public Comment

In the original wording it is not clear if the “mounting means” or the “EVSE” is intended to be either “Fastened in Place” or “Fixed in Place”.

The wording could imply that if the mounting means was the part that was fixed in place using fasteners and a tool, the assembly would be considered “fixed in place”. Yet, the EVSE could be simply hung on the mounting means for ease of removal or relocation so it would not actually be fixed in place.

The suggested change clarifies that it is the EVSE, not the mounting means, which is either “fastened in place” to permit relocation, etc. or “fixed in place”.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company's name, trade name, trademark or other authorized identification should be considered as being covered by UL's Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL's have similar requirements.

The .6 section of this Article is not used, the committee statement that “The numbering was not changed due to the impact on manufacturer’s documentation” is not in conformance with 2.4.1 of the NEC style manual. This will make the NEC more user friendly by following an already established pattern that the .6 section of an article is typically associated with listing requirements such as 324.6, 334.6, 340.6, 342.6, 410.6 etc...

</tr>
</thead>
<tbody>
<tr>
<td>EV_Connector.jpg</td>
<td>Image of EV Connector with recognized component mark.</td>
<td></td>
</tr>
<tr>
<td>FFVI2_Guide_Information.pdf</td>
<td>Guide Information for EV Connectors and Inlets</td>
<td></td>
</tr>
</tbody>
</table>

Statement of Problem and Substantiation for Public Comment

Based on the committee statement, "labeled would not be practically enforceable," this would also apply to the term listed since this section permits for the option of either listed or labeled. Therefore, the entire second sentence should be deleted. NEC Section 625.5 already requires that all electrical materials, devices, fittings, and associated equipment shall be listed. 625.2 defines an EV coupler as being the mating of the EV inlet and the EV connector. The definition of EV inlet and EV connector identifies both products as a device.

Therefore, the last sentence of Section 625.16 is redundant and actually creates a conflict as EV connectors and inlets are not listed, but only recognized components that are intended for use as components of listed equipment. Electric Vehicle Plugs, Receptacles, Couplers and Inlets are covered by UL Product Category FFVI2 which states that the devices covered under this category are incomplete in certain constructional features or restricted in performance capabilities and are intended for use as components of complete equipment submitted for investigation rather than for direct separate installation in the field.

Committee Statement

Committee Action: Accepted
Resolution: SR-3342-NFPA 70-2015
Statement: Listing and labeling is covered by 625.5 (new 625.6 per Second Revision No. 3341) and does not need to be repeated here.
(A) Power-Supply Cord.

The cable for cord-connected equipment shall comply with all of the following:

1. Be any of the types specified in 625.17(B) or hard service cord, junior hard service cord, or portable power cable types in accordance with Table 400.4. Hard service cord, junior hard service cord, or portable power cable types shall be listed, as applicable, for exposure to oil and damp and wet locations.

2. Have an ampacity as specified in Table 400.5(A)(1) or, for 8 AWG and larger, in the 60°C columns of Table 400.5(A)(2).

3. Have an overall length as specified in 625.17(A)(3)a. or b as follows:

4. When the interrupting device of the personnel protection system specified in 625.22 is located within the enclosure of the supply equipment or charging system, the power-supply cord shall be not more than

   - 300 mm
   - 915 mm (36 in.)

5. When the interrupting device of the personnel protection system specified in 625.22 is located at the attachment plug, or within the first 300 mm (12 in.) of the power-supply cord, the overall cord length shall be a minimum of 1.8 m (6 ft) and shall be not greater than 4.6 m (15 ft).

Statement of Problem and Substantiation for Public Comment

300mm (12 in.) power cord is too short for most installations where the EVSE is wall mounted in a typical garage and studs are spaced at the standard 16 in. (and some are 24 in.) apart. Mounting an EVSE equipped with a power cord and plug to the wall and installing a power outlet at the next closest stud would require more than a 12 in. cord length for all practical purposes.

This proposal is for stationary (as opposed to portable) EVSEs. The concern with "protecting" a length of cord longer than 12 in. minimized as the EVSE enclosure is expected to be fastened in place at a height of not less than 18 in. off the floor (Article 625.50). We propose allowing a longer cord (36 in.) and yet not so long that it would touch the floor or be subjected to snagging thus increasing the risk of damage.

Resolution: Relaxing protection requirements does not add to practicality of installation and could increase the risk to the end user.
Output Cable.

The output cable to the electric vehicle shall be one of the following:

(1) Output Cable to the Primary Pad.

If used, the output cable to the primary pad shall be Type EV, EVE, or EVT flexible cable as specified in Table 400.4. The output cable shall have an ampacity as specified in Table 400.5(A)(1) or, for 8 AWG and larger, in the 60°C columns of Table 400.5(A)(2).

(2) Output Cable to the Primary Pad.

Exception to (B)(1): Listed electric vehicle supply equipment may incorporate output cables having ampacities greater than those in Table 400.5(A)(2).

Exception to (B)(2): An approved wiring system may be permitted in place of the output cable to the primary pad. [See 625.102(E)].

based on the permissible temperature limits for the components and the cable.

Statement of Problem and Substantiation for Public Comment

Removal of reference to Table 400.5(A)(1) in the 2014 code was a correct step toward moving away from using the NEC as an end product safety standard which was never intended. The only types of cable allowed on the output of an EVSE are those mentioned in 625.17(B)(1) above, namely EV cables per UL 62, and none of those cables are called out by Table 400.5(A)(1) and in fact EV cables did not exist until recently. It is also interesting that 625.17(B)(1) does not specify which column of Table 400.5(A)(1). For some reason, the center column seem to be the default but there is nothing preventing the third column from being used which also allows higher currents to be used. Similarly, it is difficult to understand the technical reason for the reference to Table 400.5(A)(2) for cables 8 AWG and larger. EV cables are designed for their intended purpose and all EV types are available up to 105°C. It has been argued that without the reference to these tables there would be no guidance but Article 400.5(A) clearly states “These tables shall be used in conjunction with applicable end-use product standards to ensure selection of the proper size and type.” When Article 625 was written there were no end product standards for EVSE but now we have ANSI tri-national UL 2594 for guidance for the end products as well as UL 2202. There is no evidence to suggest that manufacturers and third party test labs are not competent to select and properly evaluate appropriate conductor sizes with proper temperature ratings for safe and reliable end product service. All products from our company were tested at 32 A using 10 AWG EV cables and all passed with sizeable margin. Using the NEC as an end product...
standard tends to slow development of affordable and safe EVSE products for this emerging market by applying requirements that
were not written to cover these EVSE products

</thead>
<tbody>
<tr>
<td>Resolution</td>
<td>Panel 12 reaffirms that the ampacity tables are necessary to maintain requirements on the output cable of the EVSE and that the exceptions reduce the level of safety.</td>
</tr>
</tbody>
</table>
(1) Output Cable to the Electric Vehicle.

The output cable to the electric vehicle shall be Type EV, EVJ, EVE, EVJE, EVT, or EVJT flexible cable as specified in Table 400.4. The output cable shall have an ampacity as specified in Table 400.5(A)(1) or, for 8 AWG and larger, in the 60°C columns of Table 400.5(A)(2).

Exception to (B)(1): Listed electric vehicle supply equipment may incorporate output cables having ampacities greater than the ampacities in the 60°C columns of Table 400.5(A)(2) based on the permissible temperature limits for the components and the cable.

Statement of Problem and Substantiation for Public Comment

The proposed change effectively restores the exception in 625.17(B) of the 2014 NEC that allows output cable Ampacity to, in some cases, be higher than the value designated in the referenced tables. The proposed new exception requires that products using the exception be Listed, which will insure that such products perform within the rated temperature ratings of the components and with allowable touch temperatures.

Forcing wire gauges to be selected from a table will stifle innovation and the growth of the market for plug-in electric vehicles. Products should be evaluated based on objective metrics of actual operation of the product, not limited by a value in a table. 32 Amp EVSEs with 10AWG output cables have been successfully used for a long time, and at least two listed 32A EVSEs with 10AWG output cables are on the market now. FR3369 as written would not allow these products.

There is also a push for higher and higher charging power. Innovation will be required in order to accommodate higher currents with manageable cable sizes. For example, one auto manufacturer has deployed liquid-cooled output cables.

(1) Output Cable to the Electric Vehicle.

The output cable to the electric vehicle shall be Type EV, EVJ, EVE, EVJE, EVT, or EVJT flexible cable as specified in Table 400.4. The output cable shall have an ampacity as specified in Table 400.5(A)(1) or, for 8 AWG and larger, in the 60°C columns of Table 400.5(A)(2).

Exception to (B)(1): Listed electric vehicle supply equipment may incorporate output cables having ampacities greater than the ampacities in the 60°C columns of Table 400.5(A)(2) based on the permissible temperature limits for the components and the cable.

Statement of Problem and Substantiation for Public Comment

This "Code is not intended as a design specification..." (NEC Article 90.1(A)).

Section 625.17(B)(1), as written, does not allow improvements nor innovation on cable technologies used for delivering power to EVs. The NEC referenced table(s) prescribes conductor sizes based on materials and geometry rather than the actual temperature of the conductors which is the primary driver for conductor sizing. Any new developments in insulation or conductor materials, cooling technology, etc. enabling a cable to be lighter, more flexible, and easier to use would not be allowed because such cable is not covered in the existing cited Table(s). This seriously hampers progress in this growing industry and goes directly against the original intent of the Code for not being a "design spec" used to dictate how products should be created.

This proposal basically restores the exception in 625.17(B) of the 2014 NEC which allows Listed EVSEs output cable ampacity to be higher (in some cases) than the value designated in the referenced tables. Listed EVSE products are required to go through extensive testing which includes, but not limited to verifying that the device actually performs within the rated temperature ratings of the components and within allowable safe surface touch temperatures. Product specific safety standards (e.g. UL 2594) provide comprehensive requirements aimed at addressing potential hazards to a specific class of products. This type of documents are much better suited at providing safety design requirements than the NEC which has a much broader scope ("the practical safeguarding of persons and property from hazards arising from the use of electricity. (Article 90.1(A)).

With the market demand for ever longer range EVs, the need to provide faster charging requires the development of higher power charging stations. Forcing the use of certain size and type of cables precludes the innovation required to develop cables that can accommodate higher currents within a manageable/useable size. One example is the use of liquid-cooled cables which minimizes the amount of copper necessary to carry the same amount of current as a conventional cable at the same temperature. Without the proposed exception to Article 625.17(B), such cable would never be allowed to be used with an EVSE because the cited Table dictates the conductor size based on current alone without regard to other critical performance parameters.

Submittal Date: Fri Sep 25 17:50:57 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: Panel 12 reaffirms that the ampacity tables are necessary to maintain requirements on the output cable of the EVSE and that the exceptions reduce the level of safety.
(1) Output Cable to the Electric Vehicle.

The output cable to the electric vehicle shall be Type EV, EVJ, EVE, EVJE, EVT, or EVJT flexible cable as specified in Table 400.4. The output cable shall have an ampacity as specified in Table 400.5(A)(1) or, for 8 AWG and larger, in the 60°C columns of Table 400.5(A)(2).

Exception to (B)(1): Where 10 AWG and smaller circuit conductors are used in listed output charging assemblies having EV or EVJ cords rated 90°C or higher and only two conductors are carrying current, their ampacity shall be determined using the last column of Table 400.5(A)(1).

Statement of Problem and Substantiation for Public Comment

FR 3369 has been developed to permit ampacities for 10 AWG conductors to be in accordance with Table 400.5(A)(1). However, this table has ampacities listed in two different columns. One is for standard cord products with minimum temperature rating of 60°C and the other is for heater cords. The main difference between standard cord products and heater cords is that the minimum temperature rating for heater cords is 90°C and must use a thermosetting insulation and jacket. Since the ampacities in the last column of Table 400.5(A)(1) is permitted for heater cords that are also attached to appliances, these ampacities should be permitted for output charger cords that are constructed with the same materials and have the same temperature rating as heater cords.

Committee Statement

Committee Action: Rejected
Resolution: The submitter's substantiation does not justify the removal of this section. This requirement enhances safety and maintains a minimum level of safety requirements.
625.22 . Personnel Protection System.

The equipment shall have a listed system of protection against electric shock of personnel. Where cord-and-plug-connected equipment is used, the interrupting device of a listed personnel protection system shall be provided and shall be an integral part of the attachment plug or shall be located in the power-supply cord not more than 300 mm (12 in.) from the attachment plug. A personnel protection system shall not be required for supplies less than 50 volts dc.

Statement of Problem and Substantiation for Public Comment

Section 625.5 requires that EVSE shall be listed, the deleted text is not necessary as this safety system is covered by the product standards as detailed in PI 3982. The committee statement that this section contains the 12 inch limitation is also not necessary as UL 2594 (Electric Vehicle Supply Equipment) clause 9.2.3(a)(1) requires that the interrupting device provided as part of the personnel protection system is required to be located at the attachment plug or not more than 12 inches from the attachment plug for portable EV cord sets and movable EV charging stations. Additionally, UL 2202 (Electric Vehicle Charging System Equipment) clause 11.4.2.6 requires that cord and plug connected units shall have ground fault protection for personnel as an integral part of the attachment plug or located in the cable not more than 12 inches from the attachment plug. Therefore, if the product is listed, as required by NEC Section 625.5 and labeled as required by the certification body this personnel protection an the location of this personnel protection is already addressed.

Public Comment No. 1199-NFPA 70-2015 [ Section No. 625.44 ]

625.44  Equipment Connection.
Equipment shall be connected to the premises wiring system in accordance with one of the following:

(A)  Portable Equipment.
Portable equipment shall be connected to the premises wiring systems by one of the following methods:

(1) A nonlocking, 2-pole, 3-wire grounding-type receptacle outlet rated at 125 volt, single phase, 15 or 20 amperes
(2) A nonlocking, 2-pole, 3-wire grounding-type receptacle outlet rated 50 volts dc maximum, 15 or 20 amperes
(3) A nonlocking, 2-pole, 3-wire grounding-type receptacle outlet rated 250 volts, single phase, 15 or 20 amperes

The length of the power supply cord, if provided, between the receptacle outlet and the equipment shall be in accordance with 625.17(A)(3).

(B)  Stationary Equipment.
Stationary equipment intended to be fastened in place in such a way as to permit ready removal for interchange, facilitation of maintenance or repair, or repositioning, shall be connected to the premises wiring system by one of the following methods:

(1) A nonlocking, 2-pole, 3-wire grounding-type receptacle outlets rated 250 volt, single phase, up to 50 amperes
(2) A nonlocking, 3-pole, 4-wire grounding-type receptacle outlet rated 250 volt, three phase, up to 50 amperes
(3) Any of the receptacle outlets in 625.44(A) (1) or (2).

The length of the power supply cord, if provided, between the receptacle outlet and the equipment shall be in accordance with 625.17(A)(3).

(C)  Fixed Equipment.
All other equipment shall be permanently wired and fastened in place to the supporting surface, a wall, a pole, or other structure.

Statement of Problem and Substantiation for Public Comment

The text of FR3379 is identical to the originally proposed FR as suggested in the first draft meetings in January, with one exception. This exception was to remove one line in 625.44(A) concerning the use of 250 V ac, single phase receptacles as suitable receptacles for portable devices. The text of this FR should have been identical to the originally proposed FR without the removal of this one line. The FR should be as shown below:

The 2014 NEC allowed the use of 240 V, cord-and-plug connected portable devices, but the wording used in the code indicated that these portable devices were to be fastened in place during use. The text actually states “fastened in place to facilitate repositioning of portable devices” which is not clear as pointed out in the substantiation for multiple PIs for this clause.

The use of 240 V portable devices was never prohibited by the 2014 edition of the code. With the change as shown in FR3379, the 2017 edition of the code will be prohibiting a piece of equipment that was allowed to be used for the last 3 years with a lack of any reported concerns in the field. On what basis is the panel disallowing the use of 240 V ac cord-and-plug connected portable devices? The FR should have included the reference to 240 V ac portable devices as shown.

Committee Statement

Committee Action: Rejected
Resolution: The committee reaffirms its position that portable EVSEs are limited to 125 volt 20 amperes maximum as stated during the 2014 revision cycle in the committee statement to comment 12-25 Log #1375 and First Revision No. 3379 committee statement. There is insufficient substantiation provided to revise the requirements.
Public Comment No. 1075-NFPA 70-2015 [Section No. 625.44(A)]

(A) Portable Equipment.

Portable equipment shall be connected to the premises wiring systems by one or more of the following methods:

1. A nonlocking, 2-pole, 3-wire grounding-type receptacle outlet rated at 125 volt, single phase, 15 or 20 amperes
2. A nonlocking, 2-pole, 3-wire grounding-type receptacle outlet rated at 250 volt, single phase, 15 or 20 amperes
3. A nonlocking, 2-pole, 3-wire or 3-pole, 4-wire grounding-type receptacle outlet rated at 250 volt, single phase, 30 or 50 amperes
4. A nonlocking, 2-pole, 3-wire grounding-type receptacle outlet rated 50 volts dc maximum, 15 or 20 amperes

The length of the power supply cord, if provided, between the receptacle outlet and the equipment shall be in accordance with 625.17(A) (3).

Statement of Problem and Substantiation for Public Comment

Section 625.44 and its predecessor 625.13 (before 2014) have always been unclear in wording and interpretation. Early on there was disagreement on whether the NEC allowed any form of plug-in 250V EVSE. More recently there has been disagreement on whether 250V portable EVSEs are allowed and the definition of “fastened in place”.

The change proposed here is to return to the version developed and approved in CMP12 Task Group 3 in January 2015 as the starting point, with changes as follows:

1) In line (A) add “or more” to include the possibility that a portable EVSE could be configured to plug in to more than one outlet type. AeroVironment’s Turbocord and Tesla’s Mobile Connector both can plug in to more than one outlet type.

2) Add a new line restoring 15- and 20-Amp receptacles at 250V as it was in the Task Group 3 draft.

3) Add a new line listing allowed 30- and 50-Amp receptacles, and adding 3-pole, 4-wire receptacles. 3-pole, 4-wire receptacles are not necessary for vehicle charging (as the neutral is not used), but there is no reason to exclude them. With their additional plug-blade, these receptacles provide even better plug security than 2-pole receptacles. Portable 250V cordsets with 4-wire plugs are standard equipment in one large EV manufacturer’s products.

Technically, there is no valid reason to exclude 250V portable products.

- All 250V portable products have no more than 125V to ground.
- 125V portable EVSEs are not required to be used with GFCI outlets. Ground fault charge current interruption protection (CCID) is included in all EVSEs.
- All types of 250V plug-in appliances and devices, including EVSEs, have a potential 250V line-to-line shock hazard from the plug blades when plugging or unplugging. This is deemed an acceptable risk in the current NEC and previous revisions of the NEC.

Millions of Outdoor receptacles rated 125 VAC are in homes in the United States, many without GFCI protection. GFCIs have been required in receptacles primarily to provide ground fault protection from failures or misuse of end products. Electric vehicle supply equipment always has built-in personal protection for ground faults called a “charge current interrupting device” (CCID). The only risk being mitigated by a GFCI outlet when used for powering an EVSE is protection from contacting a single plug blade and getting a shock to ground. We are not aware of any electric shock incidents in connection with charging vehicles through electric vehicle supply equipment, and specifically none from contact with plug blades while plugging in electric vehicle supply equipment.

Note also that the Voltage to ground of 250VAC is 125VAC -- the same as a 125VAC circuit.

Multiple models of 250V portable EVSEs are already in use in North America. Some are labelled and NRTL Listed as stationary fastened in place, but are physically very small and marketed as easy to take with you on the go (avoiding the word “portable”). Others are NRTL Listed as portable products. In addition, a large number of portable 250V EVSEs have been delivered with each Tesla Model S. Volvo will be including a portable 125/250V portable EVSE with every new 2016 XC90 plug-in hybrid vehicle. There are already tens of thousands of “portable” 250V EVSEs in use today in the United States alone. Due to charge times and increasing battery pack sizes on EVs/PHEVs, there is existing and growing market demand for 250V portable EVSEs. These products will not go away if 625.44(A) is adopted as-is – but NRTL Listings and independent safety evaluations of these products would no longer be possible.

Committee Statement

Committee Action: Rejected

Resolution: The committee reaffirms its position that portable EVSEs are limited to 125 volt 20 amperes maximum as stated during the 2014 revision cycle in the committee statement to comment 12-25 Log #1375 and First Revision No. 3379 committee statement. There is insufficient substantiation provided to revise the requirements.
Portable equipment shall be connected to the premises wiring systems by one or more of the following methods:

1. A nonlocking, 2-pole, 3-wire grounding-type receptacle outlet rated at 125 volt, single phase, 15 or 20 amperes
2. A nonlocking, 2-pole, 3-wire grounding-type receptacle outlet rated 250 volt, single phase, 15 or 20 amperes
3. A nonlocking, 2-pole, 3-wire or 3-pole, 4-wire grounding-type receptacle rated at 250 volt, single phase, 30 or 50 amperes
4. A nonlocking, 2-pole, 3-wire grounding-type receptacle outlet rated 50 volts dc maximum, 15 or 20 amperes

The length of the power supply cord, if provided, between the receptacle outlet and the equipment shall be in accordance with 625.17(A) (3).

Statement of Problem and Substantiation for Public Comment

Electric vehicles benefit from higher charging rates achievable with 250V rated portable equipment. There is no verifiable technical or safety related reason to prohibit 250V products. IEC, SAE, and GB standards all include portable products at over 200V.

Section 625.44 and its predecessor 625.13 (before 2014) have always been unclear in wording and interpretation. The change proposed here is to return to the version developed and approved in CMP12 Task Group 3 in January 2015 which enables improvements and innovations in EVSE products to come to the market without compromising safety.

We also propose two enhancements to that version in order to account for improved product designs for electric vehicle owners:

1) In line (A) add “or more” to include the possibility that a portable EVSE could be configured to plug in to more than one outlet type. This adds much needed flexibility for EV users to charge their vehicles when travelling as it allows the use of different outlet types.

2) Add a new line listing allowed 30- and 50-Amp receptacles, and adding 3-pole, 4-wire receptacles. 3-pole, 4-wire receptacles are not necessary for vehicle charging (as the neutral is not used), but there is no reason to exclude them. With their additional plug-blade, these receptacles provide even better plug security than 2-pole receptacles.

From a safety engineering point of view, there is no valid reason to exclude 250V portable products.

- 125V portable EVSEs are not required to be used with GFCI outlets. And even if it was required, it is clearly impractical to enforce such requirement given the fact that the devices are portable. Therefore, a ground fault current interruption device (CCID) is built in inside all EVSEs by design to afford the user such protection anywhere the EVSE is used.
- All types of 250V plug-in appliances and devices, including EVSEs, have a potential 250V line-to-line shock hazard from the plug blades when plugging or unplugging. However, the solution to this is for our industry to develop more "touch safe" plugs rather than banning the existing plugs that had been in use for decades and are the same ones used in EVSE products now to take advantage of existing infrastructure.
- The concern with 250V rated devices being heavier and putting stress on the outlet is mostly unfounded because most portable EVSEs have a wide input range and are physically the same unit (it is just rated 125V-250V). Furthermore, 250V plugs/receptacles are physically larger (e.g. NEMA 14-50 outlets) and provide much better blade retention than the 125V ones (e.g. NEMA 5-15), so if a 125V outlet can take the EVSE, a 250V outlet can certainly take it as well.

As stated in the very first paragraph of the Code (Article 90.1(A), the purpose of the NEC is the “practical safeguarding of persons and property”. Limiting consumer options and/or banning an entire class of EVSEs is certainly not practical from the public’s point of view.

These products will not go away if 625.44(a) is adopted as-is – but NRTL Listings and independent safety evaluations of these products would no longer be possible.

As the President of ClipperCreek, and as a major supplier of cord sets to the automotive industry, I can attest that the industry is moving to delivering 240V cord sets with the vehicle. If the NEC specifically disallows the products, the result will be that vehicles will be delivered with unlisted cord set products in the trunk developed to automakers standards instead of the harmonized Tri-national UL standards will become the norm.

Committee Statement

Committee Action: Rejected
Resolution: The committee reaffirms its position that portable EVSEs are limited to 125 volt 20 amperes maximum as stated during the 2014 revision cycle in the committee statement to comment 12-25 Log #1375 and First Revision No. 3379 committee statement. There is insufficient substantiation provided to revise the requirements.
Public Comment No. 1481-NFPA 70-2015 [Sections 625.44(A), 625.44(B)]

Sections 625.44(A), 625.44(B)

(A) Portable Equipment.

Portable equipment shall be connected to the premises wiring systems by one of the following methods:

(1) A nonlocking, 2-pole, 3-wire grounding-type receptacle outlet rated at 125 volt or 250 volt, single phase, 15 or 20 amperes

(2) A nonlocking, 2-pole, 3-wire grounding-type receptacle outlet rated 50 volts dc maximum, 15 or 20 amperes

The length of the power supply cord, if provided, between the receptacle outlet and the equipment shall be in accordance with 625.17(A)(3).

(B) Stationary Equipment.

Stationary equipment intended to be fastened in place in such a way as to permit ready removal for interchange, facilitation of maintenance or repair, or repositioning, shall be connected to the premises wiring system by one of the following methods:

(1) A nonlocking, 2-pole, 3-wire grounding-type receptacle outlets rated 125 volt or 250 volt, single phase, up to 50 amperes

(2) A nonlocking, 3-pole, 4-wire grounding-type receptacle outlet rated 250 volt, three phase, up to 50 amperes

(3) Any of the receptacle outlets in 625.44(A) (1) or (2)

The length of the power supply cord, if provided, between the receptacle outlet and the equipment shall be in accordance with 625.17(A)(3).

Statement of Problem and Substantiation for Public Comment

Cord and plug connected EVSE intended for connection to either 125 volt or 250 volt receptacles has been Listed for years, as evidenced in the 2014 National Electrical code, Article 625.44(A) and (B). Requirements covering these products can be found in UL2594, Standard for Electric Vehicle Supply Equipment and in SAE J1772, Standard for SAE Electric Vehicle and Plug in Hybrid Electric Vehicle Conductive Charge Coupler.

The proposal in the first report would eliminate a class of EVSE that has been installed successfully and used without incident for years.

Committee Statement

Committee Action: Accepted
Resolution: SR-3303-NFPA 70-2015
Statement: Panel 12 is making these edits to keep the referenced standard current.
Public Comment No. 164-NFPA 70-2015 [Section No. 640.3(B)]

(B) Ducts, Plenums, and Other Air-Handling Spaces.
Section 300.22(B) shall apply to circuits and equipment installed in ducts specifically fabricated for environmental air. Section 300.22(C) shall apply to circuits and equipment installed in other spaces used for environmental air (plenums).

Exception No. 1: Class 2 and Class 3 cables installed in accordance with 725.135(B) and Table 725.154 shall be permitted to be installed in ducts specifically fabricated for environmental air.

Exception No. 2: Class 2 and Class 3 cables installed in accordance with 725.135(C) and Table 725.154 shall be permitted to be installed in other spaces used for environmental air (plenums).

Informational Note: NFPA 90A-2015, Standard for the Installation of Air Conditioning and Ventilating Systems, 4.3.10.2.6.5, permits loudspeakers, loudspeaker assemblies, and their accessories listed in accordance with UL 2043-2008, Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces, to be installed in other spaces used for environmental air (ceiling cavity plenums).

Statement of Problem and Substantiation for Public Comment

In the informational note, UL 2043 edition is updated.

640.25 Loudspeaker Installation in Fire Resistance-Rated Partitions, Walls, and Ceilings.

Loudspeakers installed in a fire resistance–rated partition, wall, or ceiling shall be listed, labeled and identified for that purpose or installed in an enclosure or recess that maintains the fire resistance rating.

Informational Note: Fire-rated construction is the fire-resistive classification used in building codes. One method of determining fire rating is testing in accordance with NFPA 256-2003, Standard Methods of Fire Tests of Roof Coverings.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3305-NFPA 70-2015
Statement: Panel 12 revised the requirements by adding the words "and labeled, or identified" to ensure the integrity of the fire resistive rated wall, partition or ceiling. If a product is listed and labeled it would be identified for the purpose. The term is redundant and not needed. Added "as speaker assemblies for fire resistance" to characterize the types of speaker assemblies required from others that would not fulfill the requirements. Additionally, removed the portion of the Informational Note referencing NFPA 256, since that standard has been withdrawn.
640.25 Loudspeaker Installation in Fire Resistance-Rated Partitions, Walls, and Ceilings.

Loudspeakers installed in a fire resistance-rated partition, wall, or ceiling shall be listed for that purpose or installed in an enclosure or recess that maintains the fire resistance rating.

Informational Note: Fire-rated construction is the fire-resistant classification used in building codes. One method of determining fire rating is testing in accordance with NFPA 256-2003, Standard Methods of Fire Tests of Roof Coverings.

Statement of Problem and Substantiation for Public Comment

In the informational note, removed reference to NFPA 256 since has been withdrawn.

| Statement:        | Panel 12 revised 640.42 to meet the requirements of the Style Manual as per the CC direction. Added “Installation of” to provide clarity to the requirement. |
Public Comment No. 25-NFPA 70-2015 [Section No. 645.1]

645.1 Scope.
This article covers equipment, power-supply wiring, equipment interconnecting wiring, and grounding of information technology equipment and systems in an information technology equipment room.

Informational Note: For further information, see NFPA 75-2013, Standard for the Fire Protection of Information Technology Equipment, which covers the requirements for the protection of information technology equipment and information technology equipment areas.

Statement of Problem and Substantiation for Public Comment

NFPA 75 is in the 2015 Fall Revision Cycle. The NITMAM posting date is 10/16/2015. If there are no certified NITMAMs, the 2016 edition of NFPA 75 will be issued on 11/10/2015.

Committee Action: Rejected but see related SR
Resolution: SR-3307-NFPA 70-2015
Statement: The rewording of the scope of Article 645 is to clarify the Panel’s intent of Article 645. This intent is clearly worded in 645.4 (2011 and 2014), but has been misinterpreted as being mandatory. The Panel requests that the Correlating Committee approve this scope editing.

Additionally, the Panel updated the edition date of NFPA 75 to the current edition.
Circuits and equipment shall comply with 645.3(A) through (G), as applicable.

Statement of Problem and Substantiation for Public Comment

The Panel added two new subparagraphs (H) and (I) to 645.3, "Other Articles." This editorial comment notes the need to change the introductory paragraph to recognize the new sections.

Bonding and Grounding.

The non–current-carrying conductive members of optical fiber cables in an information technology equipment room shall be bonded and grounded in accordance with 770.114.

Statement of Problem and Substantiation for Public Comment

FR 3342 added the words "bonded and", correctly acknowledging that bonding and grounding are two separate but closely related topics, but did not include the word "bonding" to the title. 645.3(C) also references to 770.114, which states that "optical fiber cables shall be bonded to a grounded equipment rack or enclosure." This comment adds "bonding" to the title of paragraph 645.3(C).

Resolution: SR-3310-NFPA 70-2015
Statement: Panel 12 revised the title to include "Bonding and" to match the language in the text.
645.4 Special Requirements for Information Technology Equipment Room.

Alternate wiring methods to the provisions of Chapter 3 and Article 708 for power wiring, Parts I and III of Article 725 for signaling wiring, Section 708.14 and Parts I and V of Article 725 for optical fiber cabling, shall be permitted where all of the following conditions are met:

1. Disconnecting means complying with 645.10 are provided.
2. A heating/ventilating/air-conditioning (HVAC) system is provided in one of the methods identified in 645.4(2) a or b.
3. A separate HVAC system that is dedicated for information technology equipment use and is separated from other areas of occupancy; or
4. An HVAC system that serves other occupancies and meets all of the following:
   a. Also serves the information technology equipment room
   b. Provides fire/smoke dampers at the point of penetration of the room boundary
   c. Activates the damper operation upon initiation by smoke detector alarms, by operation of the disconnecting means required by 645.10, or by both

Informational Note: For further information, see NFPA 75.

2013

5. All information technology and communications equipment installed in the room is listed.
6. The room is occupied by, and accessible to, only those personnel needed for the maintenance and functional operation of the installed information technology equipment.
7. The room is separated from other occupancies by fire-resistant-rated walls, floors, and ceilings with protected openings.

Informational Note: For further information on room construction requirements, see NFPA 75.

2013

8. Only electrical equipment and wiring associated with the operation of the information technology room is installed in the room.

Informational Note: HVAC systems, communications systems, and monitoring systems such as telephone, fire alarm systems, security systems, water detection systems, and other related protective equipment are examples of equipment associated with the operation of the information technology room.

Statement of Problem and Substantiation for Public Comment

NFPA 75 is in the 2015 Fall Revision Cycle. The NITMAM posting date is 10/16/2015. If there are no certified NITMAMs, the 2016 edition of NFPA 75 will be issued on 11/10/2015.

Committee Action: Rejected
Resolution: Section 645.6 (I) was moved to 645.3 “Other Articles” and renumbered 645.3(I) by First Revision No. 3350 which was approved and appears in the FDR text on TerraView. The correction to 645.3 has been made by Second Revision No. 3308. This explanation complies with the Correlating Committee direction to reconsider the First Revision No. 3350 voting comment.
(E) Under Raised Floors.

Power cables, communications cables, connecting cables, interconnecting cables, cord-and-plug connections, and receptacles associated with the information technology equipment shall be permitted to be installed under a raised floor, provided the following conditions are met:

1. The raised floor is of approved construction, and the area under the floor is accessible.
2. Ventilation in the underfloor area is used for the information technology equipment room only, except as provided in 645.4(2).
3. Openings in raised floors for cords and cables protect cords and cables against abrasion and minimize the entrance of debris beneath the floor.

The installation of branch circuit conductors shall be in accordance with 645.5(E)(1). The installation of electrical supply cords, data cables, interconnecting cables, and grounding conductors shall be in accordance with 645.5(E)(2). The installation of optical fiber cables shall be in accordance with 645.5(E)(3).

(1) Installation Requirements for Branch Circuit Supply Conductors Under a Raised Floor.

(a) The supply conductors shall be installed in accordance with the requirements of 300.11.

(b) In addition to the wiring methods of 300.22(C), the following wiring methods shall also be permitted:

1. Rigid metal conduit
2. Rigid nonmetallic conduit
3. Intermediate metal conduit
4. Electrical metallic tubing
5. Electrical nonmetallic tubing
6. Metal wireway
7. Nonmetallic wireway
8. Surface metal raceway with metal cover
9. Surface nonmetallic raceway
10. Flexible metal conduit
11. Liquidtight flexible metal conduit
12. Liquidtight flexible nonmetallic conduit
13. Type MI cable
14. Type MC cable
15. Type AC cable
16. Associated metallic and nonmetallic boxes or enclosures
17. Type TC power and control tray cable
The following cords, cables and conductors shall be permitted to be installed under a raised floor:

1. Supply cords of listed information technology equipment in accordance with 645.5(B)
2. Interconnecting cables enclosed in a raceway
3. Equipment grounding conductors
4. In addition to wiring installed in compliance with 725.135(C), Types CL2R, CL3R, CL2, and CL3 and substitute cables including CMP, CMR, CM, and CMG installed in accordance with 725.154(A) shall be permitted under raised floors.

Informational Note: Figure 725.154(A) illustrates the cable substitution hierarchy for Class 2 and Class 3 cables.

5. Listed Type DP cable having adequate fire-resistant characteristics suitable for use under raised floors of an information technology equipment room

Informational Note: One method of defining fire resistance is by establishing that the cables do not spread fire to the top of the tray in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2011, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable. Another method of defining fire resistance is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA “Vertical Flame Test — Cables in Cable Trays,” as described in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

(3) Installation Requirements for Optical Fiber Cables Under a Raised Floor.

In addition to optical fiber cables installed in accordance with 770.113(C), Types OFNR, OFCR, OFN, and OFC shall be permitted under raised floors.

Updating the reference to CSA 22.2, the official CSA standard number is C22.2 NO. 0.3-09.
(E) Under Raised Floors.

Power raceways, power cables, communications cables, connecting cables, interconnecting raceways and cables, cord-and-plug connections, and receptacles associated with the information technology equipment shall be permitted to be installed under a raised floor, provided the following conditions are met:

(1) The raised floor is of approved construction, and the area under the floor is accessible.

(2) Ventilation in the underfloor area is used for the information technology equipment room only, except as provided in 645.4(2).

(3) Openings in raised floors for cords and cables protect cords and cables against abrasion and minimize the entrance of debris beneath the floor.

The installation of branch circuit conductors shall be in accordance with 645.5(E)(1). The installation of electrical supply cords, data cables, interconnecting cables, and grounding conductors shall be in accordance with 645.5(E)(2). The installation of optical fiber cables shall be in accordance with 645.5(E)(3).

(1) Installation Requirements for Branch Circuit Supply Conductors Under a Raised Floor.

(a) The supply conductors shall be installed in accordance with the requirements of 300.11.

(b) In addition to the wiring methods of 300.22(C), the following wiring methods shall also be permitted:

(1) Rigid metal conduit
(2) Rigid nonmetallic conduit
(3) Intermediate metal conduit
(4) Electrical metallic tubing
(5) Electrical nonmetallic tubing
(6) Metal wireway
(7) Nonmetallic wireway
(8) Surface metal raceway with metal cover
(9) Surface nonmetallic raceway
(10) Flexible metal conduit
(11) Liquidtight flexible metal conduit
(12) Liquidtight flexible nonmetallic conduit
(13) Type MI cable
(14) Type MC cable
(15) Type AC cable
(16) Associated metallic and nonmetallic boxes or enclosures
(17) Type TC power and control tray cable
Installation Requirements for Electrical Supply Cords, Data Cables, Interconnecting Cables and Grounding Conductors Under a Raised Floor.

The following cords, cables and conductors shall be permitted to be installed under a raised floor:

1. Supply cords of listed information technology equipment in accordance with 645.5(B)
2. Interconnecting cables enclosed in a raceway
3. Equipment grounding conductors
4. In addition to wiring installed in compliance with 725.135(C), Types CL2R, CL3R, CL2, and CL3 and substitute cables including CMP, CMR, CM, and CMG installed in accordance with 725.154(A) shall be permitted under raised floors.

Informational Note: Figure 725.154(A) illustrates the cable substitution hierarchy for Class 2 and Class 3 cables.

5. Listed Type DP cable having adequate fire-resistant characteristics suitable for use under raised floors of an information technology equipment room

Informational Note: One method of defining fire resistance is by establishing that the cables do not spread fire to the top of the tray in the “UL Flame Exposure, Vertical Tray Flame Test” in UL 1685-2011, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable. Another method of defining fire resistance is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA “Vertical Flame Test — Cables in Cable Trays,” as described in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

Installation Requirements for Optical Fiber Cables Under a Raised Floor.

In addition to optical fiber cables installed in accordance with 770.113(C), Types OFNR, OFCR, OFN, and OFC shall be permitted under raised floors.

Statement of Problem and Substantiation for Public Comment

The term raceways should be added for clarification and to be specific about manufactured raceways or Contractor fabricated raceways for under raised floor applications. These fabricated assemblies are often fabricated from liquidtight flex with conductors installed and NEMA receptacles attached, with UL listing. They are technically raceways, power cable is a term more applicable to SO cord, USE cables or other types of cables.

Submittal Date: Mon Aug 17 18:09:35 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: Raceways are already specifically included. Raceways for branch circuits are covered in 645.5(E)(1)(b). Raceways for power and communications are covered in 645.5(E)(2)(2).
The supply conductors shall be installed in accordance with the requirements of 300.11.

Statement of Problem and Substantiation for Public Comment

For the life of me I never could figure out how 300.11 applies to the installation of conductors under a raised floor. Exactly what is the panel attempting to accomplish by referencing 300.11.

Committee Statement

Committee Action: Rejected
Resolution: Chapters 1 through 4 (inclusive of section 300.11) apply to all installations unless modified by Chapters 5 through 7. This section reaffirms the securing requirement revisions made for the 2014 edition of the NEC.
Installation Requirements for Electrical Supply Cords, Data Cables, Interconnecting Cables and Grounding Conductors Under a Raised Floor.

The following cords, cables and conductors shall be permitted to be installed under a raised floor:

1. Supply cords of listed information technology equipment in accordance with 645.5(B)
2. Interconnecting cables enclosed in a raceway
3. Equipment grounding conductors
4. In addition to wiring, where the air space below a raised floor is not protected by an automatic fire suppression system, wiring under the raised floor shall be installed in compliance with 725.135(C), including Type CMP substituting for Types CL2P and CL3P.
5. Where the air space below a raised floor is protected by an automatic fire suppression system, wiring installed in compliance with 725.135(C) shall be permitted under the raised floor and Types CL2R, CL3R, CL2, and CL3 and substitute cables including CMP, CMR, CM, and CMG installed in accordance with 725.154(A) shall also be permitted under raised floors. Informational Note: Figure 725.154(A) illustrates the cable substitution hierarchy for Class 2 and Class 3 cables.
6. Listed Type DP cable having adequate fire-resistant characteristics suitable for use under raised floors of an information technology equipment room

Informational Note: One method of defining fire resistance is by establishing that the cables do not spread fire to the top of the tray in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2011, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable. Another method of defining fire resistance is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test — Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M-2001, Test Methods for Electrical Wires and Cables.

Statement of Problem and Substantiation for Public Comment

The development schedule of the 2016 edition of NFPA 75, Standard for the Fire Protection of Information Technology Equipment is about 6 months ahead of the development schedule for NFPA 70. There are pending changes to the wiring requirements in NFPA 75 that will require correlating changes in Article 645.

The text of section 11.3.7 and the explanatory Annex Note A.11.3.7 in NFPA 75-2016 will be:

11.3.7* Signal wiring and cabling, including optical fiber cables, installed in an air space below a raised floor shall be listed.

11.3.7.1 Where the air space below a raised floor is protected by an automatic fire suppression system, signal wiring and cabling listed for plenum, riser and general-purpose use shall be permitted to be installed exposed to the airflow in an air space below a raised floor.

11.3.7.2 Where the air space below a raised floor is not protected by an automatic fire suppression system, only signal wiring and cabling listed for plenum use shall be permitted to be installed exposed to the airflow in an air space below a raised floor.

11.3.7.3 Where the air space below a raised floor is not protected by an automatic fire suppression system, signal wiring and cabling listed for plenum, riser and general-purpose use shall be permitted to be installed in metal raceway in an air space below a raised floor.

A11.3.7* See 9.1.1.3. The installation of general-purpose and riser cables exposed to the airflow in the air space below a raised floor is permitted only where the space is protected by an automatic fire suppression system.

Section 645.5(E) needs to be revised to permit the use on riser and general-purpose cables (Types CL2R, CL3R, OFNR, OFCR, CL2, CL3, OFN and OFC) only where the under floor space has automatic fire suppression in place.

Committee Action: Rejected but see related SR
Resolution: SR-3312-NFPA 70-2015
Statement: Panel 12 revised 645.5(E) to improve clarity by eliminating the list items and the redundancies that were included. This complies with the Correlating Committee directive.

Updating the reference to CSA 22.2, the official CSA standard number is C22.2 NO. 0.3-09.
Public Comment No. 44-NFPA 70-2015 [Section No. 645.5(E)(3)]

(3) Installation Requirements for Optical Fiber Cables Under a Raised Floor.

In addition to

1. Where the air space below a raised floor is not protected by an automatic fire suppression system, only optical fiber cables installed in accordance with 770.113(C) shall be permitted under the raised floor.

2. Where the air space below a raised floor is protected by an automatic fire suppression system, optical fiber cables installed in accordance with 770.113(C), Types OFNR, OFCR, OFN, and OFC shall be permitted under the raised floor.

Statement of Problem and Substantiation for Public Comment

The development schedule of the 2016 edition of NFPA 75, Standard for the Fire Protection of Information Technology Equipment is about 6 months ahead of the development schedule for NFPA 70. There are pending changes to the wiring requirements in NFPA 75 that will require correlating changes in Article 645.

The text of section 11.3.7 and the explanatory Annex Note A11.3.7 in NFPA 75-2016 will be:

11.3.7* Signal wiring and cabling, including optical fiber cables, installed in an air space below a raised floor shall be listed.

11.3.7.1 Where the air space below a raised floor is protected by an automatic fire suppression system, signal wiring and cabling listed for plenum, riser and general-purpose use shall be permitted to be installed exposed to the airflow in an air space below a raised floor.

11.3.7.2 Where the air space below a raised floor is not protected by an automatic fire suppression system, only signal wiring and cabling listed for plenum use shall be permitted to be installed exposed to the airflow in an air space below a raised floor.

11.3.7.3 Where the air space below a raised floor is not protected by an automatic fire suppression system, signal wiring and cabling listed for plenum, riser and general-purpose use shall be permitted to be installed in metal raceway in an air space below a raised floor.

A11.3.7* See 9.1.1.3. The installation of general-purpose and riser cables exposed to the airflow in the air space below a raised floor is permitted only where the space is protected by an automatic fire suppression system.

Section 645.5(E) will need to be revised to permit the use on riser and general-purpose cables (Types CL2R, CL3R, OFNR, OFCR, CL2, CL3, OFN and OFC) only where the under floor space has automatic fire suppression in place.

Committee Statement

Committee Action: Rejected but held
Resolution: Holding this revision, awaiting the issuance of NFPA 75-2017 for final language.
Securing in Place.

Power cables; communications cables; connecting cables; interconnecting cables; and associated boxes, connectors, plugs, and receptacles that are listed as part of, or for, information technology equipment shall not be required to be secured in place where installed under raised floors.

Informational Note: Cables listed for information technology equipment are not required to be secured in place. For all other underfloor cables see 645.5(E) and 300.11.

Statement of Problem and Substantiation for Public Comment

FR #3349 added the words "where installed under raised floors" to ensure that cables or cables in raceway installed above a raised floor are secured in place. The Panel statement that "The panel retains the requirement of securing raceways" implies that the common practice of using ITE listed liquid-tight flexible conduit under a floor would require fastening in place. That was probably not the panel's intent, which probably meant to address raceways above the floor. An informational note is provided to clarify the sections of the code that apply to cables that are not listed for information technology equipment. 300.11 covers securing and supporting of supply conductors. 645.5(E) covers branch circuits under a raised floor. Readers might perceive a contradiction between 645.5(E)(2) and 645.5(F).

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3315-NFPA 70-2015
645.18 Surge Protection for Critical Operations Data Systems
Surge protection shall be provided for critical operations data systems.

Statement of Problem and Substantiation for Public Comment
FR 3356 added the new 645.18 to require surge protection for critical operations data systems. This requirement, which recognizes a standard best practice in all ITE rooms, is basically unenforceable. Use of surge protectors must be carefully engineered and can appear in many places within a data center, from upstream switchgear through distribution systems, equipment racks, and even integrated into the IT equipment itself. Improper use of surge equipment, such as clamping to an incorrect voltage, improper installation, or improper series-connected devices, can actually increase the risk of critical equipment shutdown. 645.18 gives no guidance to the installer or to the authority having jurisdiction. The entire requirement is not useful and is unenforceable. 645.18 should be deleted.

Committee Statement
Committee Action: Rejected
Resolution: Panel 12 reaffirms its position to include requirements for surge protection in critical operations data systems. The regulation is broad to allow various technologies to be used to comply with the rule. The Code is not intended as a design specification.
Public Comment No. 773-NFPA 70-2015 [Section No. 645.18]

645.18 Surge Protection for Critical Operations Data Systems
Surge protection shall be provided for critical operations data systems.

Statement of Problem and Substantiation for Public Comment

IEC's position is to delete proposed new section 645.18 (FR 3356).

The panel has not provided any substantiation that a problem exists. The panel has also not provided a location or energy level needed to meet this requirement. Most if not all Data Systems come with internal isolation transformers located within UPS equipment that act as a large inductor damping or eliminating transients as they are created on the input to the equipment. Switching transients on the load side of the UPS are highly unlikely.

Committee Statement

Committee Action: Rejected
Resolution: Panel 12 reaffirms its position to include requirements for surge protection in critical operations data systems. The regulation is broad to allow various technologies to be used to comply with the rule. The Code is not intended as a design specification.
646.1 Scope.

This article covers modular data centers.

Informational Note No. 1: Modular data centers include the installed information technology equipment (ITE) and support equipment, electrical supply and distribution, wiring and protection, working space, grounding, HVAC, and the like, that are located in an equipment enclosure.

Informational Note No. 2: For further information, see NFPA 75-2013, Standard for the Protection of Information Technology Equipment, which covers the requirements for the protection of information technology equipment and systems in an information technology equipment room.

Statement of Problem and Substantiation for Public Comment

NFPA 75 is in the 2015 Fall Revision Cycle. The NITMAM posting date is 10/16/2015. If there are no certified NITMAMs, the 2016 edition of NFPA 75 will be issued on 11/10/2015.

Informational Note: Environmentally controlled working spaces, aisles, and equipment areas in an MDC are not considered a plenum.

Statement of Problem and Substantiation for Public Comment

FR 3398 Revised the introductory paragraph in 646.3(B) to be in bullet form and to apply to spaces above an ITE room. ITE rooms are covered by Article 645. This is Article 646 for Modular Data Centers. This comment revises the text to apply to Modular Data Centers. The reference to CATV in 646.3(B)(6) is revised to show the correct NEC section.

Resolution: SR-3321-NFPA 70-2015
Statement: Panel 12 clarifies that 646.3(B) applies to all environmental air spaces (plenums) within the Modular Data Center. The Panel also edited the references in list items to the correct sections and tables.
(F) Cable Routing Assemblies _and_ Communications Wires, Cables, Raceways, and Equipment.

Parts I, II, III, IV, and V of Article 800 shall apply to cable routing assemblies, communications wires, cables, raceways, and equipment installed in an MDC. Only communications wires and cables listed in accordance with 800.179, cable routing assemblies and communications raceways listed in accordance with 800.182, and communications equipment listed in accordance with 800.170 shall be permitted to be installed in an MDC.

Informational Note: See Part I of Article 100 for a definition of communications equipment.

**Statement of Problem and Substantiation for Public Comment**

FR 3401 changed the title of 646.3(F) from "Communications Equipment" to "Cable Routing Assemblies, Communications Wires, Cable, Raceways, and Equipment." This editorial comment inserts the word "AND" to distinguish cable routing assemblies from communications equipment; cable routing assemblies are not communications wires, cables, raceways or equipment.

Zip: 
Submittal Date: Tue Sep 29 11:18:29 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3323-NFPA 70-2015
Statement: Panel 12 made editorial revisions to comply with Correlating Committee directive by rewording the section to be Style Manual compliant while maintaining the intended requirements and permissions.
(H) Storage Batteries.

Installation of storage batteries shall comply with Article 480.

Exception: Batteries that are part of listed and labeled equipment and installed in accordance with the listing requirements shall not be required to be installed in compliance with Article 480.

Informational Note: Batteries that are integrated components within a listed device are not subject to Article 480. Battery systems that are assembled at the site are subject to all of the provisions of Article 480.

Statement of Problem and Substantiation for Public Comment

Batteries that are components within a piece of listed information technology equipment (ITE) are included in the safety listing of that product and are not subject to Article 480 for stationary batteries. Such systems, although listed, might not always have a label. Batteries that are in a battery cabinet (e.g., UPS systems) or are assembled on racks in battery rooms fall under Article 480. In the latter case, the individual single-cell or multi-cell container should be listed and, depending upon the size of the container, might be labeled. These components are assembled into a system which can include such things as inter-cell, inter-tier, and inter-rack connectors, overcurrent protective devices, monitoring system, or other elements which together constitute a battery system. If factory-assembled, as in the case of a battery cabinet, the cabinet might be listed and labeled. When a battery system is assembled at site, the system will not be listed or labeled, although the individual components might be listed or recognized. This comment removes the words "and labeled." It also adds a new informational note to clarify that batteries embedded into listed ITE equipment are not covered by Article 480.

(B) MDCs Connected to Branch Circuits and Feeders.

Modular data centers that connect to a branch circuit or a feeder circuit shall have a short-circuit current rating not less than the available fault current of the branch circuit or feeder. The short-circuit current rating of the MDC shall be based on the short-circuit current rating of a listed and labeled MDC or the short-circuit current rating established utilizing an approved method.

Informational Note No. 1: UL 508A-2001 2013, Standard for Industrial Control Panels, Supplement SB, is an example of an approved method.

Informational Note No. 2: This requirement does not apply to listed and labeled equipment connected to branch circuits located inside of the MDC equipment enclosure.

Statement of Problem and Substantiation for Public Comment

Referenced current edition of UL 508A.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-3326-NFPA 70-2015
Statement: Panel 12 removed the first sentence for clarification. The sentence implied that only listed information technology equipment could be installed in the MDC, which is incorrect.
Only listed information technology equipment shall be permitted to be installed in an MDC. Electrical equipment that is an integral part of the MDC, including information technology equipment, lighting, control, power, HVAC (heating, ventilation, and air-conditioning), emergency lighting, alarm circuits, and so forth, shall comply with the requirements for its use and installation and shall be listed and labeled.

Statement of Problem and Substantiation for Public Comment

This is an editorial comment to add clarity. The language that was added in FR 3406 could be easily misinterpreted to mean that nothing but ITE could be installed in an MDC... which of course was not the intent. This comment follows the format of 645.4(3), which states: "All information technology and communications equipment installed in the room is listed."

Resolution: SR-3326-NFPA 70-2015
Statement: Panel 12 removed the first sentence for clarification. The sentence implied that only listed information technology equipment could be installed in the MDC, which is incorrect.
650.1 Scope.
This article covers those electrical circuits and parts of electrically operated pipe organs that are employed for the control of the keyboards and of the sounding apparatus, typically organ pipes.

Informational Note: The typical pipe organ is a very large musical instrument. See Informational Note Figure 650.1.

Informational Note Figure 650.1 The illustration shows the pipes of a pipe organ.

Statement of Problem and Substantiation for Public Comment
The Correlating Committee directs that further consideration be given to the comments expressed in voting relative to the usefulness of the Informational Note and Figure. Additionally, the entire section must be revised to comply with the NEC Style Manual.

Committee Statement
Committee Action: Rejected but see related SR
Resolution: SR-3316-NFPA 70-2015
Statement: The revised text complies with the Correlating Committee directive. The Panel has deleted the illustration and added additional text to the informational note for clarity. The revision to the Informational Note makes the section in compliance with the Style Manual.
668.1 Scope.

The provisions of this article apply to the installation of the electrical components and accessory equipment of electrolytic cells, electrolytic cell lines, and process power supply for the production of aluminum, cadmium, chlorine, copper, fluorine, hydrogen peroxide, magnesium, sodium, sodium chlorate, and zinc.

Not covered by this article are cells used as a source of electric energy and for electroplating processes and cells used for the production of hydrogen.

Informational Note No. 1: In general, any cell line or group of cell lines operated as a unit for the production of a particular metal, gas, or chemical compound may differ from any other cell lines producing the same product because of variations in the particular raw materials used, output capacity, use of proprietary methods or process practices, or other modifying factors to the extent that detailed Code requirements become overly restrictive and do not accomplish the stated purpose of this Code.

Public Comment No. 755-NFPA 70-2015 [Section No. 670.5(2)]

(2)
Industrial machinery shall be legibly marked in the field with the maximum available fault current. The field marking(s) shall include the date the fault-current calculation was performed and be of sufficient durability to withstand the environment involved.

Statement of Problem and Substantiation for Public Comment

IEC's position is to delete 670.5 - (FR 3336)

The code already requires that equipment be installed according to available fault current, so adding this requirement is redundant. The installer/supplier already has the responsibility/liability to install the proper equipment based on the characteristics of the system. This proposal puts too much liability on the contractor/supplier because after installation various factors can change which will affect the available fault current. Feeders can be reworked, transformers can be changed with different impedance values, motor loads can be added to the existing system and similar factors that can change the available fault current. In the case of a lawsuit, the installer will have the burden of proof that the installation was done according to code and would result in unnecessary costs for defending an installation that was installed correctly, but that had variables change that are out of their control. A better proposal would be to require the owner to relabel the equipment after any alteration to the system.

Submittal Date: Fri Sep 18 20:50:59 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: First Revision No. 3336 added requirements to ensure that industrial machinery is properly installed and eases enforcement. Requiring a field marking of the available fault current, at the industrial machinery, ensures the equipment is installed where fault currents do not exceed the equipment’s short circuit current rating as required in 670.5 (1).
Public Comment No. 775-NFPA 70-2015 [Section No. 670.6]

Industrial machinery with safety interlock circuits shall have surge protection installed.

Statement of Problem and Substantiation for Public Comment

IEC’s position is to delete 670.6 (FR 3357)

No substantiation has been provided by the submitter that a surge protection device is needed for industrial machinery with safety interlocks. The proposed text does not provide where the surge protection is located, and does not provide how to rate or size the surge protection. This is a design issue and the user of the standard may very well have surge protection upstream of the machine and adding another unit may be redundant and not necessary.

Committee Statement

Committee Action: Rejected
Resolution: The committee reaffirms its position to include requirements for surge protection in industrial machinery. Technical substantiation was provided in the committee statement to First Revision No. 3357 and Public Input No. 4156. The regulation is broad to allow various technologies to be used to comply with the rule.
680.4 Approval of Equipment.
All electrical equipment installed in the water, walls, or decks of pools, fountains, and similar installations shall comply with the provisions of this article. Equipment and products shall be listed for swimming pool and spa use.

Statement of Problem and Substantiation for Public Comment

Wanting equipment and products used in the swimming pool and spa environment to be listed is a good thing, but listed for what? Prior to the 2005 NEC revision cycle, the NEC Technical Correlating Committee issued a directive to all of the Code Making Panels to clear up what "listed for the purpose" meant in their particular articles. In other words, don't just tell the user of the Code that something has to be "listed for the purpose" but tell us what that purpose is. That 2005 Code cycle was when CMP-17 changed 680.23(A)(2) from "transformers or power supplies used to supply underwater luminaires shall be listed for the purpose" to "transformers or power supplies used to supply underwater luminaires shall be listed for swimming pool and spa use." The presently proposed text would allow any equipment that was "listed" to used in the swimming pool and spa environment. This equipment could be "listed" for a dry location. Simply trying to close a loop-hole here gentleman.

Committee Statement
Committee Action: Rejected but see related SR
Resolution: SR-4815-NFPA 70-2015
Statement: The text "listed" alone would allow for listed units that would require the Inspection Authority to search in various databases of the certification agencies while conducting inspection in the field. This is inconvenient and sometimes difficult. The text "and labeled" was added as this would mandate a certification (listing) mark on the product or its smallest unit container for small components such as wire connectors. The text "for swimming pool use" was not added to this section as it would then apply to all electrical products used in the Article. This would include conduit, wire connectors and grounding and bonding equipment that are not listed for swimming pool use. Text such as "identified for swimming pool and spa use" would be appropriate in other sections of the Article.
680.7, Grounding and Bonding Terminals.

Grounding and bonding terminals shall be identified for use in wet and corrosive environments. Field-installed grounding and bonding connections in a damp, wet, or corrosive environment shall be composed of copper, copper alloy, or stainless steel. They shall be listed for direct burial or concrete-encasement use.

Statement of Problem and Substantiation for Public Comment

Ground clamps listed and identified for use with rebar are typically listed for concrete encasement (not just direct burial if at all). These rebar ground clamps are used regularly for the equipotential bonding grid at swimming pool structures. By adding "or concrete-encasement" will enhance this requirement.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4816-NFPA 70-2015
Statement: The requirements for grounding and bonding equipment in UL 467 do not at present have an option of a rating "wet or corrosive environments". Requirements in UL 467 for a rating of direct burial would mandate materials that have proven resistant to the corrosive environments around swimming pool equipment: stainless steel, copper and high copper content copper alloys. The text "or concrete encasement" is not necessary as the marking for the listed terminal would be "direct burial or DB". The text "and labeled" was added as this would mandate a certification (listing) mark on the product or its smallest unit container for small components such as wire connectors. The text "listed" alone would allow for listed units that would require the Inspection Authority to search in various databases of the certification agencies while conducting inspection in the field. This is inconvenient and sometimes difficult.
680.21 Motors.

(A) Wiring Methods.

The wiring to a pool motor shall comply with (A)(1) unless modified for specific circumstances by (A)(2), (A)(3), (A)(4), or (A)(5).

(1) General.

Where branch circuits for pool-associated motors are subject to physical damage and/or installed in wet, damp, or corrosive environments, that portion of the branch circuit shall be installed in rigid metal conduit, intermediate metal conduit, rigid polyvinyl chloride conduit, reinforced thermosetting resin conduit, or Type MC cable, suitable for the conditions subject to that location.

Wiring methods installed in these locations shall contain an insulated copper equipment grounding conductor sized in accordance with Table 250.122 but not smaller than 12 AWG.

Where installed in dry, noncorrosive environments, branch circuits shall comply with the general requirements in Chapter 3.

(2) Flexible Connections.

Where necessary to employ flexible connections at or adjacent to the motor, liquidtight flexible metal or liquidtight flexible nonmetallic conduit with listed fittings shall be permitted.

(3) Cord-and-Plug Connections.

Pool-associated motors shall be permitted to employ cord-and-plug connections. The flexible cord shall not exceed 900 mm (3 ft) in length. The flexible cord shall include a copper equipment grounding conductor sized in accordance with 250.122 but not smaller than 12 AWG. The cord shall terminate in a grounding-type attachment plug.

(B) Double Insulated Pool Pumps.

A listed cord-and-plug-connected pool pump incorporating an approved system of double insulation that provides a means for grounding only the internal and nonaccessible, non–current-carrying metal parts of the pump shall be connected to any wiring method recognized in Chapter 3 that is suitable for the location. Where the bonding grid is connected to the equipment grounding conductor of the motor circuit in accordance with the second sentence of 680.26(B)(6)(a), the branch-circuit wiring shall comply with 680.21(A).

(C) GFCI Protection.

Outlets supplying pool pump motors connected to single-phase, 120-volt through 240-volt branch circuits, whether by receptacle or by direct connection, shall be provided with ground-fault circuit-interrupter protection for personnel.

(D) SPGFCI Protection. Outlets supplying pool pump motors connected to single-phase and three-phase branch circuits, rated more that 150 volts to ground and up to 600 volts between ungrounded conductors, 100 amperes or less, whether by receptacle or by direct connection, shall be provided with special-purpose ground-fault circuit-interrupter protection for personnel.

Statement of Problem and Substantiation for Public Comment

The committee resolution of PI-2207 was: "GFCIs rated in excess of 250 volts do not always provide protection against "let-go" (devices trip at up to 20 mA) which is important when dealing with bodies of water due to the risk of drowning".

The submitter agrees with the committee that GFCI classes C, D and E (collectively referred to as SPGFCIs) don't provide let-go protection because of the 20 mA trip level which is above the let-go threshold. Yet, SPGFCIs provide protection against ventricular fibrillation, the condition that typically leads to cardiac arrest resulting in drowning. SPGFCIs use the same tripping characteristics of Class A GFCIs (A graph of the tripping characteristics is submitted with the support material of this public comment). The only difference is that the start of the curve (i.e. tripping action) is delayed from 6 mA to 20 mA (moved to the right).

Accordingly, SPGFCIs provide the exact protection level of Class A GFCIs for ground faults of 20 mA and higher. In other words, SPGFCIs are guaranteed to interrupt the source of power fast enough, and therefore protecting the person in the water from drowning, because the current going through the swimmer’s heart is interrupted.

During the first draft meeting, CMP 2 recognized SPGFCIs as a potential improvement to safety and created FR-339 and FR-347 to include a new definition for SPGFCIs and an installation requirement in Article 210.8(B) respectively.

<tbody>
<tr>
<td>Resolution:</td>
<td>This comment does not address the elevated risk of submersion, electroshock drowning, in a body of water and that muscular constriction starts at a level well below ventricular fibrillation. Due to the fact that muscular constriction would result in loss of body control, the ability to stay afloat or get out of the body of water would be severely impaired, leading to a high possibility of drowning. There is no substantiation that larger pumps have created an issue for occupants within the body of water. The higher trip level of the SPGFCI is not adequate for prevention of drowning.</td>
</tr>
</tbody>
</table>
(1) **General.**

Where branch circuits for pool-associated motors that are subject to physical damage and/or installed in, shall be installed in a wiring method that is identified for protection against physical damage. Branch circuits installed in wet, damp, or corrosive environments, that portion of the branch circuit, shall be installed in rigid metal conduit, intermediate metal conduit, rigid polyvinyl chloride conduit, reinforced thermosetting resin conduit, or Type MC cable, suitable for the conditions subject to a wiring method that is identified for the specific condition(s) at that location. Wiring methods installed in these locations shall contain an insulated copper equipment grounding conductor sized in accordance with Table 250.122 but not smaller than 12 AWG.

Where installed in dry, noncorrosive environments, branch circuits shall comply with the general requirements in Chapter 3.

**Statement of Problem and Substantiation for Public Comment**

This Comment is intended to simplify the Panel's stated goal of simplifying the wiring methods permitted for branch circuits to pool associated motors. However, some serious oversights are corrected in this Comment. For example, all PVC conduit is not identified for protection against physical damage or for all corrosive environments. Only Schedule 80 is suitable for protection against physical damage. PVC conduit in Schedules 40 and 80 are suitable for some but not all corrosive conditions. The manufacturers can and will willingly provide the list of corrosive conditions the PVC conduit is suitable for. Type RTRC conduit is not permitted where subject to physical damage unless identified for such use. This is stated in 355.12(C) under "Uses Not Permitted." Where subject to physical damage unless identified for such use. The UL White Book indicates only RTRC conduit with a suffix "XW" is suitable for protection against physical damage.

The term "identified" is defined in Article 100 and is recommended for use in this Section. It means recognized as suitable for the use. Manufacturers, product standards or the NEC in the XXX.10 and XXX.12 sections identify the Uses Permitted and Not Permitted. Furthermore, these wiring methods are required to be listed which provides information to the installer and inspector that the wiring method is suitable for the application.

**Resolution:** SR-4818-NFPA 70-2015  
**Statement:** Wiring methods that have been specifically evaluated for the type of corrosive environment around swimming pool pumps and sanitation chemicals are not as yet readily available. Made revisions to correlate with new Section 680.14. The wiring methods have had acceptable field history in swimming pool installations. The First Draft text referencing resistance to physical damage is not necessary as it applies to all wiring methods.
Public Comment No. 783-NFPA 70-2015 [Section No. 680.22(A)]

(A) Receptacles.

(1) Required Receptacle, Location.
Where a permanently installed pool is installed, no fewer than one 125-volt, 15- or 20-ampere receptacle on a general-purpose branch circuit shall be located not less than 1.83 m (6 ft) from, and not more than 6.0 m (20 ft) from, the inside wall of the pool. This receptacle shall be located not more than 2.0 m (6 ft 6 in.) above the floor, platform, or grade level serving the pool.

(2) Circulation and Sanitation System, Location.
Receptacles that provide power for water-pump motors or for other loads directly related to the circulation and sanitation system shall be located at least 1.83 m (6 ft) from the inside walls of the pool. These receptacles shall have GFCI protection and be of the grounding type.

(3) Other Receptacles, Location.
Other receptacles shall be not less than 1.83 m (6 ft) from the inside walls of a pool.

(4) GFCI Protection.
All 15- and 20-ampere, single-phase, 125-volt receptacles located within 6.0 m (20 ft) of the inside walls of a pool shall be protected by a ground-fault circuit interrupter.

(5) SPGFCI Protection
All 100 amperes or less, single-phase and three-phase receptacles rated more than 150 volts to ground and up to 600 volts between ungrounded conductors, located within 6.0 (20 ft) of the inside walls of a pool shall be protected by a special-purpose ground-fault circuit interrupter.

(6) Measurements.
In determining the dimensions in this section addressing receptacle spacings, the distance to be measured shall be the shortest path the supply cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening, or other effective permanent barrier.

Public Comment No. 1100-NFPA 70-2015 [Section No. 680.22(A)(2)]

(2) Circulation and Sanitation System, Location.

Receptacles that provide power for water-pump motors or for other loads directly related to the circulation and sanitation system shall be located at least 1.83 m (6 ft) from the inside walls of the pool. These receptacles shall have GFCI protection and be of the grounding type, or not less than 900 mm (3 ft) from the inside walls of the pool if they meet all of the following conditions:

(1) Consist of a single receptacle
(2) Employ a locking configuration
(3) Be of the grounding type
(4) Include GFCI protection

Statement of Problem and Substantiation for Public Comment

This section got fouled up when the consistent distance of 1.83 m (6 ft) was desired and created for Article 680 during the 2008 NEC Code cycle. Prior to this 1.83 (6 ft) consistent distance for all or most measurements in Article 680, all receptacle outlets had to be at least 3.0 m (10 ft) from the water's edge except for the pool pump motor receptacle outlet, which could be located up to 1.5 m (5 ft) from the pool if it meet certain conditions (single, locking and grounding type, GFCI protected). This single and locking configuration eliminates someone plugging in a radio or something like that into the receptacle dedicated to the pool pump motor and setting the radio right beside the pool's edge. Pool equipment (including motors) are installed in close proximity to pools and spas on a regular basis. Since this change in the 2008 NEC, this is a common complaint among pool contractors and installers is that the NEC would no longer allow the receptacle for the pool pump motor to be located in close proximity to the pool as well. this restriction typically results in the motor being hard-wired. Any equipment located within 1.5 m (5 ft) of the pool would have to be bonded to the equipotential bonding grid. Any electrical equipment (pool pump motor) would have to be connected to the equipotential bonding grid regardless of it's location to the pool. With the single, locking and grounding type, GFCI-protected receptacle, I see no hazard that this allowance would create. This same basic requirement was part of the Code for years prior to the 2008 NEC and resulted in no major issues that I'm aware of.

Committee Statement

Committee Action: Rejected
Resolution: The 3 foot requirement would be new material not subject to the proper public review. As was discussed in the panel meeting during the PI stage, most equipment packages are being supplied without the required twistlock cord cap, thus creating a field modification to a piece of listed equipment. A receptacle placed 3 ft. from the inside walls of the pool would place the pump and other related equipment within the reach of occupants of the pool. Ground fault protection for personnel is not considered sufficient in this area.
(7) Low-Voltage Gas-Fired Electronic Luminaires, Fired Luminaires, Decorative Fireplaces, Fire Pits and Similar Equipment

Listed and labeled low-voltage gas-fired electronically ignited luminaires and outdoor luminaire lighting appliances with fired luminaires, decorative fireplaces, fire pits and similar equipment using low-voltage ignitors that do not require grounding, that do not exceed the low-voltage contact limit, and that are supplied by listed and labeled transformers or power supplies that comply with 680.23(A)(2) with outputs that do not exceed the low-voltage contact limit, shall be permitted to be located less than 1.5 m (5 ft) from the inside walls of the pool. Metallic luminaires and outdoor luminaire lighting appliances, equipment, shall be bonded in accordance with the requirements in 680.26(B). Transformers or power supplies supplying this type of equipment shall be installed in accordance with the requirements in 680.24. Metallic gas piping shall be bonded in accordance with the requirements in 250.104(B) and 680.26(B)(7).

Statement of Problem and Substantiation for Public Comment

Clarification of the meaning of “outdoor luminated lighting appliances” is required. This type of equipment includes gas-fired fireplaces, fire pits and similar equipment. In addition, clarification is needed that it is the equipment power supply that is “low voltage.” The text “and labeled” was added to replicate similar changes made by the Panel.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company's name, trade name, trademark or other authorized identification should be considered as being covered by UL's Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company's name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

First Revision No. 4803-NFPA 70-2015 [Global Input]

Submitter Information Verification
Committee Statement

Committee Action: Accepted
Resolution: SR-4821-NFPA 70-2015
Statement: The text “listed” alone would allow for listed units that would require the Inspection Authority to search in various databases of the certification agencies while conducting inspection in the field. This is inconvenient and sometimes difficult. The text “and labeled” was added as this would mandate a certification (listing) mark on the product. The additional text “and identified” accurately reflects the Definitions in Chapter 1. It is appropriate in this instance as there are Listed and Labeled equipment readily available that are not intended for swimming pool installations.
Public Comment No. 1055-NFPA 70-2015 [Section No. 680.25(1)]

(1) Feeders.
Where feeders are subject to physical damage and/or installed in wet, damp, or corrosive environments, that portion of the feeder shall be installed in rigid metal conduit, intermediate metal conduit, rigid polyvinyl chloride conduit, or reinforced thermosetting resin conduit, or listed cable wiring method, suitable for the conditions. Where installed in dry, noncorrosive environments, feeders shall comply with the general requirements in Chapter 3. Wiring methods installed in wet, damp, or corrosive environments shall contain an insulated copper or covered equipment grounding conductor sized in accordance with Table 250.122, but not less than 12 AWG copper or 10 AWG aluminum or copper-clad aluminum, shall be required.

Statement of Problem and Substantiation for Public Comment

There is lack of substantiation for what constitutes a defined "corrosive environment" and for adding copper as the "only" acceptable equipment grounding conductor when installed in wet, damp or corrosive environment. Section 250.118 permits copper, aluminum, or copper-clad aluminum that is insulated, covered, or bare as an equipment grounding conductor, so is the covered aluminum conductor in Type SE Cable, which is acceptable in a wet location above ground, considered a "corrosive environment"? For example, there is no evidence that Type SE-R Cable supplied from an exterior meter/main service equipment (wet location), that then enters the structure (on its path to an interior remote panelboard that may supply branch circuits to a pool application) is a shock hazard, yet it would be prohibited under the new language. However, if the FR 4863 is accepted as written it would have a negative impact on the use of a well-established and listed product that has a proven track record in wet, damp and dry locations. In addition, physical damage when considering corrosive locations is well established in Section 338.12(A)(1), (2) and (3) and if a specific location is determined to be a corrosive environment, Section 250.120(B) would also provide guidance. Type SE Cable, Both Style U and R have been used for many years in wet and damp locations which are arguably considered corrosive environments without any serious issues. The FR proposed by CMP 17 did not provide any guidance on what they considered a "corrosive environment" to support the new language.

Committee Statement

Committee Action: Rejected
Resolution: See action taken in Second Revision No. 4817. The editorial additions to the code are considered new material, and therefore have not been reviewed by the public during the PI stage. Regarding the listed wiring method addition, the area around and near the pool is subject to conditions that require a prescriptive robust wiring method to maintain the protections needed for bodies of water that are subject to human activities. The panel needs more information regarding the PVC coated cable being acceptable for these locations. Also we need information regarding the ability of AL and copper-clad aluminum to withstand the exposure to the corrosive environments associated with pools and spas.
Public Comment No. 1243-NFPA 70-2015 [Section No. 680.25(1)]

(1) Feeders.
Where feeders are subject to physical damage and/or installed in wet, damp, or corrosive environments, that portion of the feeder shall be installed in rigid metal conduit, intermediate metal conduit, rigid polyvinyl chloride conduit, or reinforced thermosetting resin conduit, suitable for the conditions. Where installed in dry, noncorrosive environments, feeders shall comply with the general requirements in Chapter 3. Wiring methods installed in wet, damp, or corrosive environments shall contain an insulated copper equipment grounding conductor sized in accordance with Table 250.122, but not less than 12 AWG shall be required.

Informational Note: This would include the feeder/branch circuit to a self-contained spa or hot tub disconnect whether the disconnecting means has supplementary overcurrent device(s) in it or not.

Statement of Problem and Substantiation for Public Comment

There are a lot of AHJs that can't agree if you have to have an insulated EGC inside of the building to a hot tub disconnect. Some say you do if the disconnect has the GFCI breaker in it, because then it is a feeder. Then you don't if you put the GFCI in the main service then put a nonfusible disconnect by the hot tub, then it is a branch circuit. I have seen NM cable from the service to the hot tub disconnect for as long as I have been in the field, but then in the last couple years there has been confusion on this.

Committee Statement

Committee Action: Rejected
Resolution: The condition described in the Informational Note is covered by 680.42 and 680.43. There is no need to add this note at this location. This is a violation of the NEC style manual as you can't have requirements in an informational note.
Public Comment No. 731-NFPA 70-2015 [Section No. 680.25(1)]

(1) Feeders.
Where feeders are subject to physical damage, and/or, the wiring method shall be identified for protection against such damage. Wiring methods installed in wet, damp, or corrosive environments, that portion of the feeder shall be installed in rigid metal conduit, intermediate metal conduit, rigid polyvinyl chloride conduit, or reinforced thermosetting resin conduit, suitable for the conditions shall be identified for such locations. Where installed in dry, noncorrosive environments, feeders shall comply with the general requirements in Chapter 3. Wiring methods installed in wet, damp, or corrosive environments shall contain an insulated copper equipment grounding conductor sized in accordance with Table 250.122, but not smaller than 12 AWG shall be required.

Statement of Problem and Substantiation for Public Comment

This Comment is intended to simplify the Panel's stated goal of simplifying the wiring methods permitted for feeders. However, some serious oversights are corrected in this Comment. For example, all PVC conduit is not identified for protection against physical damage or for all corrosive environments. Only Schedule 80 is suitable for protection against physical damage. PVC conduit in Schedules 40 and 80 are suitable for some but not all corrosive conditions. The manufacturers can and will willingly provide the list of corrosive conditions the PVC conduit is suitable for. Type RTRC conduit is not permitted where subject to physical damage unless identified for such use. This is stated in 355.12(C) under "Uses Not Permitted." Where subject to physical damage unless identified for such use. The UL White Book indicates only RTRC conduit with a suffix "XW" is suitable for protection against physical damage.

The word "less" is replaced with "smaller" because "less" refers to quantity and "smaller" refers to the size which is the subject of the size of the equipment grounding conductor. The ending phrase "shall be required" is repetitive of the requirement earlier in the sentence as thus is shown being deleted.

Public Comment No. 1310-NFPA 70-2015 [ Section No. 680.43(D) ]

(D) Bonding.

The following parts shall be bonded together:

1. All metal fittings within or attached to the spa or hot tub structure.
2. Metal parts of electrical equipment associated with the spa or hot tub water circulating system, including pump motors, unless part of a listed, labeled and identified self-contained spa or hot tub.
3. Metal raceway and metal piping that are within 1.5 m (5 ft) of the inside walls of the spa or hot tub that are not separated from the spa or hot tub by a permanent barrier.
4. All metal surfaces that are within 1.5 m (5 ft) of the inside walls of the spa or hot tub and that are not separated from the spa or hot tub area by a permanent barrier.
   
   Exception: Small conductive surfaces not likely to become energized, such as air and water jets and drain fittings, where not connected to metallic piping, towel bars, mirror frames, and similar nonelectrical equipment, shall not be required to be bonded.

5. Electrical devices and controls that are not associated with the spas or hot tubs and that are located less than 1.5 m (5 ft) from such units; otherwise, they shall be bonded to the spa or hot tub system.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark
provides evidence of listing or labeling, which may be required by installation codes or standards." Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Statement of Problem and Substantiation for Public Comment

The committee resolution of PI-2208 was: “GFCIs rated in excess of 250 volts do not always provide protection against "let-go" (devices trip at up to 20 mA) which is important when dealing with bodies of water due to the risk of drowning”.

The submitter agrees with the committee that GFCI classes C, D and E (collectively referred to as SPGFCIs) don't provide let-go protection because of the 20 mA trip level which is above the let-go threshold. Yet, SPGFCIs provide protection against ventricular fibrillation, the condition that typically leads to cardiac arrest resulting in drowning. SPGFCIs use the same tripping characteristics of Class A GFCIs (A graph of the tripping characteristics is submitted with the support material of this public comment). The only difference is that the start of the curve (i.e. tripping action) is delayed from 6 mA to 20 mA (moved to the right).

Accordingly, SPGFCIs provide the exact protection level of Class A GFCIs for ground faults of 20 mA and higher. In other words, SPGFCIs are guaranteed to interrupt the source of power fast enough, and therefore protecting the person in the water from drowning, because the current going through the swimmer’s heart is interrupted.

During the first draft meeting, CMP 2 recognized SPGFCIs as a potential improvement to safety and created FR-339 and FR-347 to include a new definition for SPGFCIs and an installation requirement in Article 210.8(B) respectively.

Committee Statement

Committee Action: Rejected
Resolution: This comment does not address the elevated risk of submersion, electroshock drowning, in a body of water and that muscular constriction starts at a level well below ventricular fibrillation. Due to the fact that muscular constriction would result in loss of body control, the ability to stay afloat or get out of the body of water would be severely impaired, leading to a high possibility of drowning. There is no substantiation that larger pumps have created an issue for occupants within the body of water. The higher trip level of the SPGFCI is not adequate for prevention of drowning.
Public Comment No. 1313-NFPA 70-2015 [Section No. 680.62(A)(1)]

(1) Listed Units.

Submittal Date: Sun Sep 20 16:16:40 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: This comment does not address the elevated risk of submersion, electroshock drowning, in a body of water and that muscular constriction starts at a level well below ventricular fibrillation. Due to the fact that muscular constriction would result in loss of body control, the ability to stay afloat or get out of the body of water would be severely impaired, leading to a high possibility of drowning. There is no substantiation that larger pumps have created an issue for occupants within the body of water. The higher trip level of the SPGFCI is not adequate for prevention of drowning.
680.74 - Bonding
(A) - General
The following parts shall be bonded together:
(1) All metal fittings within or attached to the tub structure that are in contact with the circulating water
(2) Metal parts of electrical equipment associated with the tub water circulating system, including pump and blower motors
(3) Metal-sheathed cables and raceways and metal piping that are within 1.5 m (5 ft) of the inside walls of the tub and not separated from the tub by a permanent barrier
(4) All exposed metal surfaces that are within 1.5 m (5 ft) of the inside walls of the tub and not separated from the tub area by a permanent barrier
(5) Electrical devices and controls that are not associated with the hydromassage tubs and that are located within 1.5 m (5 ft) from such units

Exception No. 1: Small conductive surfaces not likely to become energized, such as air and water jets, supply valve assemblies, and drain fittings not connected to metallic piping, and towel bars, mirror frames, and similar nonelectrical equipment not connected to metal framing shall not be required to be bonded.

Exception No. 2: Double-insulated motors and blowers shall not be bonded.
(B) - All metal parts required to be bonded by this section shall be bonded together using a solid copper bonding jumper, insulated, covered, or bare, not smaller than 8 AWG. The bonding jumper(s) shall be required for equipotential bonding in the area of the hydromassage bathtub and shall not be required to be extended or attached to any remote panelboard, service equipment, or any electrode. In all installations a bonding jumper long enough to terminate on a replacement non-double-insulated pump or blower motor shall be provided and shall be terminated to the equipment grounding conductor of the branch circuit of the motor when a double-insulated circulating pump or blower motor is used.

Statement of Problem and Substantiation for Public Comment
This rule gets more and more absurd every three years. There has never been a documented incident (that I can find) to warrant its existence, and now we are going to have a rule that will have inspectors mandating that towel bars within 5' of a bathtub be bonded!

City:
State:
Zip:
Submittal Date: Fri Sep 25 15:59:17 EDT 2015

Committee Statement
Committee Action: Rejected
Resolution: The Panel has not been provided with any test or factual information to resolve the need for the entire set of bonding requirements in or around hydromassage bathtubs. The towel bar issue has already been addressed by First Revision No. 4870 on Section 680.74(A) Exception 1.
680.81  Equipment Approval.

Lifts shall be listed for swimming pool and spa use.

Exception No. 1: Lifts where the battery is removed for charging at another location and the battery is rated less than or equal to the low-voltage contact limit shall not be required to be listed or labeled.

Exception No. 2: Solar-operated or -recharged lifts where the solar panel is attached to the lift and the battery is rated less than or equal to 24 volts shall not be required to be listed or labeled.

Exception No. 3: Lifts that are supplied from a source not exceeding the low-voltage contact limit and supplied by listed transformers or power supplies that comply with 680.23(A)(2) shall not be required to be listed or labeled.

Statement of Problem and Substantiation for Public Comment

Wanting equipment and products used in the swimming pool and spa environment to be listed is a good thing, but listed for what? Prior to the 2005 NEC revision cycle, the NEC Technical Correlating Committee issued a directive to all of the Code Making Panels to clear up what "listed for the purpose" meant in their particular articles. In other words, don’t just tell the user of the Code that something has to be "listed for the purpose" but tell us what that purpose is. That 2005 Code cycle was when CMP-17 changed 680.23(A)(2) from "transformers or power supplies used to supply underwater luminaires shall be listed for the purpose" to "transformers or power supplies used to supply underwater luminaires shall be listed for swimming pool and spa use." The presently proposed text would allow any lift that was "listed" to used in the swimming pool and spa environment. This lift could be "listed" for a dry locations only.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-4830-NFPA 70-2015
Statement: The revision allows any lift to be used in the swimming pool and spa environment.
690.1 Scope.
This article applies to solar PV systems, other than those covered by Article 691, including the array circuit(s), inverter(s), and controller(s) for such systems. [See Figure 690.1(a) and Figure 690.1(b).] The systems covered by this article may be interactive with other electrical power production sources or stand-alone or both, and may or may not be connected to energy storage systems such as batteries. These PV systems may have ac or dc output for utilization.

Informational Note: Article 691 covers the installation of large-scale PV electric supply stations.

Resolution: SR-928-NFPA 70-2015
Statement: This revision addresses the errors in the First Draft.
Engineering Supervision.  Designed and approved
Supervised by a licensed professional engineer competent in the specific area under supervision.

Statement of Problem and Substantiation for Public Comment
The correlating committee is concerned about the use of the term Engineering Supervision. The edits in this comment remove the problematic language about engineers approving anything.

Submittal Date: Wed Sep 23 22:37:55 EDT 2015

Committee Statement
Committee Action: Rejected
Resolution: See SR 929. This also addresses the correlating committee’s concern and indirectly addresses the concern in this PC.
Engineering Supervision.
Designed and approved (or certified) by a licensed professional engineer competent in the specific area under supervision.

Statement of Problem and Substantiation for Public Comment

There is a subtle difference between the definitions of Engineering Supervision within Article 690 and 691 that we don't believe was intentional but could cause confusion if left in the current state. We suggest to make both definitions the same to avoid interpretation that Engineering Supervision within Article 690 is different than that of 691.

Submitter Full Name: JASON SPOKES
Organization: SUNPOWER CORP
Street Address: 
City: 
State: 
Zip: 
Submittal Date: Fri Sep 25 13:12:29 EDT 2015

Committee Statement
Committee Action: Rejected
Resolution: See SR 929. Adding "certified" adds a word not used in the NEC. The language in 691 and 690 related to engineering have been changed to address the submitter’s concern. This is consistent with other uses of the term "engineering supervision" throughout the Code.
Engineering Supervision.
Designed and approved by a licensed professional engineer competent engaged primarily in the specific area under supervision design of PV systems.

Statement of Problem and Substantiation for Public Comment

TerraView is incorrectly highlighting the entire definition as new. The proposed revision is to replace "competent in the specific area under supervision" with "engaged primarily in the design of PV systems".

SunPower believe that it will be very difficult for an AHJ to objectively determine whether an engineer is "competent in the specific area under supervision". Therefore, we propose using language that was modeled after the engineering supervision requirement specified in NEC 240.86(A). We also believe that it is critical that the engineer be experienced with designing PV systems. In our experience, many licensed electrical engineers lack the experience required to correctly design PV systems because of its unique characteristics. Namely, it is a current and voltage limited generator. Many licensed engineers are very experienced with designing electrical systems that deliver electricity to loads connected the grid, which is a source with "infinite" current. Since the purpose of this definition is to define the credentials of the supervising engineer that will be permitted to use alternative methods to meet the requirements in article 690, it is imperative that this person have direct experience designing PV systems. Otherwise, the engineer might make mistakes that could have dangerous consequences. We believe the requested revision to this definition will reduce the chances that this could happen.

Submitter Information Verification
Submitter Full Name: MARK ALBERS
Organization: SUNPOWER
Street Address: 
City: 
State: 
Zip: 
Submittal Date: Fri Sep 25 18:45:01 EDT 2015

Committee Statement
Committee Action: Rejected
Resolution: See SR 929. The submitter makes a good case for limiting the definition in Article 690 to engineers engaged in PV design. However, to say that an engineer must be primarily engaged in PV design is far too restrictive as a competent engineer may be involved in the 3 or 4 areas where they even spread their efforts and are competent in all these areas. The usage of engineering supervision elsewhere in 690 has been revised to address some of the concerns of the submitter.
Engineering Supervision.
Designed and approved by a licensed professional engineer competent in the specific area under supervision.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that this First Revision be reviewed and the panel take action on the use of the word “approved” as it is a defined term and does not fit the definition. The panel is also directed to review the definitions for compliance with the NEC Style Manual.

Statement: This definition has been removed because it is problematic and difficult to universally define.
Public Comment No. 702-NFPA 70-2015 [Definition: Engineering Supervision.]

Engineering Supervision.
Designed and approved by a licensed professional engineer competent in the specific area under supervision.

Statement of Problem and Substantiation for Public Comment

This definition should be removed; as stated in Article 90.1 Purpose "This code is not intended as a design specification or an instruction manual for untrained persons." The code doesn't define designed and competent engineer, one could argue that a civil engineer is competent in the specific area of fault current studies or relay settings for a substation.

Resolution: SR-932-NFPA 70-2015
Statement: The panel changed the term from “reference” to “functional” so that it does not conflict with the concepts in Article 517 and matches the International Electrotechnical Committee’s use of the term internationally.
Public Comment No. 1018-NFPA 70-2015 [Definition: Reference Grounded PV System.]

Reference Grounded PV System.
A PV system that has an electrical reference to ground that is not solidly grounded.

Informational Note: The reference to ground is often a fuse, circuit breaker, resistance device, non-isolated grounded ac circuit, or electronic means that is part of a listed ground-fault protection system. Conductors in these systems that are normally at ground potential may have voltage to ground during fault conditions.

Statement of Problem and Substantiation for Public Comment

This public comment deletes this new definition to address concerns expressed by the correlating committee. Rather than defining a new term, typical PV system configurations are still described in 690.41(A). The informational note used in the definition is revised and used to inform 690.41(A).

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Submitter Information Verification

Submitter Full Name: MARK BALDASSARI
Organization: ENPHASE ENERGY
Street Address: City: State: Zip:
Submittal Date: Wed Sep 09 16:23:28 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-933-NFPA 70-2015
Statement: The addition of "PV" does not improve the understanding of the sentence. 690.2 actually has both "ac module" and "ac PV module" in the definition.
Multiple PV Systems.

Multiple PV systems shall be permitted to be installed in or on a single building or structure. Where the PV systems are remotely located from each other, a directory in accordance with 705.10 shall be provided at each dc PV system disconnecting means.

Statement of Problem and Substantiation for Public Comment

Disconnecting means for PV systems may be either ac or dc per the new set of drawings showing identification of PV system components. Deleting the term "dc" provides for complying with the requirements

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-934-NFPA 70-2015 PC 889 - The Panel acknowledges that this section addresses only the PV system disconnecting means, which is covered in 690.13.
Statement: The panel removed the word "dc" from 690.4(D) in the first revision, but it was not properly reflected in the first draft.
Multiple PV systems shall be permitted to be installed in or on a single building or structure. Where the PV systems are remotely
located from each other, a directory in accordance with 705.10 shall be provided to indicate each dc PV system disconnecting means.

Statement of Problem and Substantiation for Public Comment

The language is misleading. I believe the intent is for the directory to define the location for each "PV system" disconnecting means. For instance, with microinverters, the current language will require a sign at each dc disconnect which is located at each microinverter. It is only necessary to have disconnecting means at the output of a "PV system." The proposed language clarifies this objective.

Committee Action: Rejected but see related SR
Resolution: SR-934-NFPA 70-2015 PC 889 - The Panel acknowledges that this section addresses only the PV system disconnecting means, which is covered in 690.13.
Statement: The panel removed the word “dc” from 690.4(D) in the first revision, but it was not properly reflected in the first draft.
690.7. Maximum Voltage.

PV system dc conductors on or in one- and two family dwellings shall be permitted to have a maximum voltage of 600 volts or less. PV system dc conductors on or in other types of buildings shall be permitted to have a maximum voltage of 1000 volts or less.

(A) Photovoltaic Source and Output Circuits.

In a dc PV source circuit or output circuit, the maximum PV system voltage for that circuit shall be calculated in accordance with one of the following methods:

1. The sum of the PV module rated open-circuit voltage of the series connected modules corrected for the lowest expected ambient temperature using the open-circuit voltage temperature coefficients in accordance with the instructions included in the listing or labeling of the module.

2. For crystalline and multicrystalline silicon modules, the sum of the PV module rated open-circuit voltage of the series connected modules corrected for the lowest expected ambient temperature using the correction factor provided in Table 690.7(A).

   Informational Note: One source for statistically valid, lowest-expected, ambient temperature design data for various locations is the chapter titled Extreme Annual Mean Minimum Design Dry Bulb Temperature found in the ASHRAE Handbook — Fundamentals, 2009, 2013. These temperature data can be used to calculate maximum voltage using the manufacturer’s temperature coefficients relative to the rating temperature of 25°C.

3. For PV systems with a generating capacity of 100 kilowatts or greater, an industry standard method shall be permitted to be used under engineering supervision.

Maximum voltage shall be corrected using one of the three following methods to calculate the module voltage:

1. The open-circuit voltage temperature coefficients module voltage in accordance with the instructions included in the listing of the module.

2. For crystalline and multicrystalline silicon modules, the correction factors provided in Table 690.7(A) shall be permitted to be used.

3. For PV systems with a generating capacity of 100 kilowatts or greater, alternate methods shall be permitted to be used under engineering supervision.

The maximum voltage shall be used to determine the voltage rating of conductors, cables, disconnects, overcurrent devices, and other equipment.

Table 690.7(A) Voltage Correction Factors for Crystalline and Multicrystalline Silicon Modules

</table>
(B) DC-to-DC Converter Source and Output Circuits.

In a dc-to-dc converter source and output circuit, the maximum voltage shall be calculated in accordance with 690.7(B) (1) or (2).

(1) For circuits connected to the output of a single dc-to-dc converter, the maximum voltage shall be the maximum rated voltage output of the dc-to-dc converter.

(2) For circuits connected to the output of two or more series-connected dc-to-dc converters, the maximum voltage shall be determined in accordance with the instructions included in the listing or labeling of the dc-to-dc converter.

(C) Bipolar Source and Output Circuits.

For 2-wire circuits connected to bipolar systems, the maximum voltage shall be the highest voltage between the conductors of the 2-wire circuit if all of the following conditions apply:

(1) One conductor of each circuit of a bipolar subarray is referenced to ground to prevent overvoltage of the circuit. The operation of ground-fault or arc-fault devices (abnormal operation) shall be permitted to interrupt the ground reference when the entire bipolar array becomes two distinct arrays isolated from each other and the utilization equipment.

(2) Each circuit is connected to a separate subarray.

Committee Action: Rejected but see related SR
Resolution: SR-936-NFPA 70-2015
Statement:

1. The informational note, formerly under 690.7(A)(2) is moved directly under 690.7(A) and the last phrase is removed to make it generally applicable. Also, the ASHRAE reference is updated.

2. In 690.7(A)(3), the word “kilowatts” is changed to “kW” to match the style manual.

3. The language related to “engineering supervision” is revised to be more specific as to what engineers are allowed to perform this calculation. Competency of professional electrical engineers is governed by the licensing boards.

4. The duplicative language related to voltage calculations is removed.
Maximum Voltage.

PV system dc conductors on or in one- and two-family dwellings shall be permitted to have a maximum voltage of 600 volts or less. PV system dc conductors on or in other types of buildings shall be permitted to have a maximum voltage of 1000 volts or less.

(A) Photovoltaic Source and Output Circuits.

In a dc PV source circuit or output circuit, the maximum PV system voltage for that circuit shall be calculated in accordance with one of the following methods:

1. The sum of the PV module rated open-circuit voltage of the series connected modules corrected for the lowest expected ambient temperature using the open-circuit voltage temperature coefficients in accordance with the instructions included in the listing or labeling of the module.

2. For crystalline and multicrystalline silicon modules, the sum of the PV module rated open-circuit voltage of the series connected modules corrected for the lowest expected ambient temperature using the correction factor provided in Table 690.7(A).

   Informational Note: One source for statistically valid, lowest-expected, ambient temperature design data for various locations is the chapter titled Extreme Annual Mean Minimum Design Dry Bulb Temperature found in the ASHRAE Handbook — Fundamentals, 2009. These temperature data can be used to calculate maximum voltage using the manufacturer’s temperature coefficients relative to the rating temperature of 25°C.

3. For PV systems with a generating capacity of 100 kilowatts, kW or greater, an industry standard method shall be permitted to be used under engineering supervision.

Maximum voltage shall be corrected using one of the three following methods to calculate the module voltage:

1. The open-circuit voltage temperature coefficients module voltage in accordance with the instructions included in the listing of the module.

2. For crystalline and multicrystalline silicon modules, the correction factors provided in Table 690.7(A) shall be permitted to be used.

3. For PV systems with a generating capacity of 100 kilowatts, kW or greater, alternate methods shall be permitted to be used under engineering supervision.

The maximum voltage shall be used to determine the voltage rating of conductors, cables, disconnects, overcurrent devices, and other equipment.

(B) DC-to-DC Converter Source and Output Circuits.

In a dc-to-dc converter source and output circuit, the maximum voltage shall be calculated in accordance with 690.7(B) (1) or (2).

(1) For circuits connected to the output of a single dc-to-dc converter, the maximum voltage shall be the maximum rated voltage output of the dc-to-dc converter.

(2) For circuits connected to the output of two or more series-connected dc-to-dc converters, the maximum voltage shall be determined in accordance with the instructions included in the listing or labeling of the dc-to-dc converter.

(C) Bipolar Source and Output Circuits.

For 2-wire circuits connected to bipolar systems, the maximum voltage shall be the highest voltage between the conductors of the 2-wire circuit if all of the following conditions apply:

(1) One conductor of each circuit of a bipolar subarray is referenced to ground to prevent overvoltage of the circuit. The operation of ground-fault or arc-fault devices (abnormal operation) shall be permitted to interrupt the ground reference when the entire bipolar array becomes two distinct arrays isolated from each other and the utilization equipment.

(2) Each circuit is connected to a separate subarray.

Statement of Problem and Substantiation for Public Comment

Corrections are made to comply with the NEC style manual and to use consistent language for PV source circuits.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-936-NFPA 70-2015
Statement: 1. The informational note, formerly under 690.7(A)(2) is moved directly under 690.7(A) and the last phrase is removed to make it generally applicable. Also, the ASHRAE reference is updated.

2. In 690.7(A)(3), the word “kilowatts” is changed to “kW” to match the style manual.

3. The language related to “engineering supervision” is revised to be more specific as to what engineers are allowed to perform this calculation. Competency of professional electrical engineers is governed by the licensing boards.

4. The duplicative language related to voltage calculations is removed.
PV system dc conductors on or in one- and two family dwellings shall be permitted to have a maximum voltage of 600 volts or less. PV system dc conductors on or in other types of buildings shall be permitted to have a maximum voltage of 1000 volts or less.

PV system dc conductors and equipment not on or in a building with a maximum voltage of 1500V or less do not need to comply with Article 490.

Statement of Problem and Substantiation for Public Comment

In PI#3181 it was proposed to raise the voltage limit in the scope of Art. 490 from 1000V to 2000V. The substantiation for PI#3181 pointed out that product standards for HV equipment begin at 2000V and that recent changes to product standards for low voltage equipment have raised requirements suitable for higher voltages up to 1500V or 2000V in some cases.

In particular, for the PV industry there has been a lot of work done to revise product standards for switches, circuit breakers, fuses, modules, power conversion, etc. to cover PV system voltages up to at least 1500V. Such systems should not have to use the approaches in Art. 490, which are intended to address medium voltage installations at 2.4kV and higher using HV equipment. The burden such requirements place on PV systems are not justified at system voltages of 1500V or less using appropriately rated and approved equipment.

PI#3181 was resolved, but in their Resolution statement the CMP wrote "Increasing the upper limit may be practical in microenvironments such as those covered in Articles 690 or 694...:" which indicates that it would be appropriate to narrow the scope of PI#3181 to just PV, and move it to Art. 690 and 691, which we are now doing with this Public Comment and a related one for a revision to 691.8.

Note that we would like to get both revisions accepted: this one to 690.7 and the related one for 691.8. However if the CMP feels that they cannot accept this 690.7 proposal, please consider the 691.8 proposal separately and on its own merit.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-935-NFPA 70-2015
Statement: The lead sentence was added to clearly define what maximum voltage is in PV system dc circuits.

A dash is added between "two" and "family" for consistency of terminology.

In the first and second sentence, the word "conductors" is changed to "circuits" for clarity.

A sentence was added to the first paragraph to address equipment in the dc portion PV systems up to 1500V off of buildings. The listing process covers the proper requirements for 1500Vdc and corresponds to 1000Vac above which Article 490 applies.
Public Comment No. 477-NFPA 70-2015 [Section No. 690.7 [Excluding any Sub-Sections]]

PV system dc conductors on or in one- and two family dwellings shall be permitted to have a maximum system voltage of 600 volts or less. PV system dc conductors on or in other types of buildings shall be permitted to have a maximum system voltage of 1000 volts or less.

Statement of Problem and Substantiation for Public Comment

It's the system voltage that we are discussing, not the conductor insulation voltage.

Statement of Problem and Substantiation for Public Comment

SunPower would like to thank the CMP for adopting a version of our proposal to add provisions for using the Sandia Model to calculate the Maximum PV System Voltage. It appears that two versions of 690.7(A) were included in the First Draft version of 690.7. SunPower...
supports using the first version and removing the second version as it more clearly states the requirements.

Statement of Problem and Substantiation for Public Comment

The "informational Note" should be moved to the beginning of the section. Currently the draft has located this note under list item (2). This location suggests to the reader that it only applies to list item (2). This information equally applies to list item (1) and (3). A better location would be at the top of the list items as then it would be clear the "Informational Note" applies to all list items (1) through (3).

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-936-NFPA 70-2015
Statement: 1. The informational note, formerly under 690.7(A)(2) is moved directly under 690.7(A) and the last phrase is removed to make it generally applicable. Also, the ASHRAE reference is updated.

2. In 690.7(A)(3), the word “kilowatts” is changed to “kW” to match the style manual.

3. The language related to “engineering supervision” is revised to be more specific as to what engineers are allowed to perform this calculation. Competency of professional electrical engineers is governed by the licensing boards.

4. The duplicative language related to voltage calculations is removed.
Public Comment No. 995-NFPA 70-2015 [Section No. 690.7(A)]

(A) Photovoltaic Source and Output Circuits.

In a dc PV source circuit or output circuit, the maximum PV system voltage for that circuit shall be calculated in accordance with one of the following methods:

1. The sum of the PV module rated open-circuit voltage of the series connected modules corrected for the lowest expected ambient temperature using the open-circuit voltage temperature coefficients in accordance with the instructions included in the listing or labeling of the module.

2. For crystalline and multicrystalline silicon modules, the sum of the PV module rated open-circuit voltage of the series connected modules corrected for the lowest expected ambient temperature using the correction factor provided in Table 690.7(A).

   Informational Note: One source for statistically valid, lowest-expected, ambient temperature design data for various locations is the chapter titled Extreme Annual Mean Minimum Design Dry Bulb Temperature found in the ASHRAE Handbook — Fundamentals, 2009. These temperature data can be used to calculate maximum voltage using the manufacturer’s temperature coefficients relative to the rating temperature of 25°C.

3. For PV systems with a generating capacity of 100 kilowatts or greater, an approved industry standard method shall be permitted to be used under engineering supervision.

Maximum voltage shall be corrected using one of the three following methods to calculate the module voltage:

1. The open-circuit voltage temperature coefficients module voltage in accordance with the instructions included in the listing of the module.

2. For crystalline and multicrystalline silicon modules, the correction factors provided in Table 690.7(A) shall be permitted to be used.

3. For PV systems with a generating capacity of 100 kilowatts or greater, alternate methods shall be permitted to be used under engineering supervision.

The maximum voltage shall be used to determine the voltage rating of conductors, cables, disconnects, overcurrent devices, and other equipment.

Statement of Problem and Substantiation for Public Comment

The correlating committee requested to rephrase this provision and the definition of engineering supervision. This comment allows the AHJ to decide what is an approved method. In reality, many AHJs require this type of calculation to be done by a design professional who is often an engineer.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-936-NFPA 70-2015
Statement:

1. The informational note, formerly under 690.7(A)(2) is moved directly under 690.7(A) and the last phrase is removed to make it generally applicable. Also, the ASHRAE reference is updated.

2. In 690.7(A)(3), the word “kilowatts” is changed to “kW” to match the style manual.

3. The language related to “engineering supervision” is revised to be more specific as to what engineers are allowed to perform this calculation. Competency of professional electrical engineers is governed by the licensing boards.

4. The duplicative language related to voltage calculations is removed.
Public Comment No. 492-NFPA 70-2015 [Section No. 690.7(B)]

(B) DC-to-DC Converter Source and Output Circuits.
In a dc-to-dc converter source and output circuit, the maximum voltage shall be calculated in accordance with 690.7(B) (1) or (2).

(1) Single dc-to-dc Converter. For circuits connected to the output of a single dc-to-dc converter, the maximum voltage shall be the maximum rated voltage output of the dc-to-dc converter.

(2) Two or More Series-connected dc-to-dc Converters. For circuits connected to the output of two or more series-connected dc-to-dc converters, the maximum voltage shall be determined in accordance with either of the following methods:
   (a) The instructions included in the listing or labeling of the dc-to-dc converter.
   (b) If instructions are not included in the listing or labeling of the dc-to-dc converter, the maximum voltage shall be the sum of the maximum rated voltage output of the dc-to-dc converters in series.

Statement of Problem and Substantiation for Public Comment

DC-DC Converter instructions are not required to provide a method to calculate the maximum voltage when connecting them in series. In my experience most do not provide this information. Therefore a second method must be given in the code in the instance where the manufacturer does not provide the required method to calculate the maximum voltage. That is simply to sum up the maximum voltages of the individual devices.

State: 
Zip: 
Submittal Date: Tue Sep 01 19:50:55 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-937-NFPA 70-2015
Statement: The maximum voltage is the sum of the devices if no end-to-end control of the circuit has been evaluated. The list was reworded to remove the second list within the list and to remove repetitious language.
(C) Bipolar Source and Output Circuits.
For 2-wire circuits connected to bipolar systems, the maximum voltage shall be the highest voltage between the conductors of the 2-wire circuit if all of the following conditions apply: One conductor of each circuit of a bipolar subarray is referenced connected to ground to prevent overvoltage of the circuit. The operation of ground-fault or arc-fault devices (abnormal operation) shall be permitted to interrupt the ground reference when the entire bipolar array becomes a ground detector. At the detection of a ground-fault, the entire bipolar array shall become two distinct arrays isolated from each other and the utilization equipment. Each circuit is connected to a separate subarray to prevent overvoltage of either circuit.

Statement of Problem and Substantiation for Public Comment
This comment is to address the correlating committees concerns about use of terms related to reference grounding of PV systems. This revised language is consistent with the revised version of 690.41(A) and 250.21. Simply stated, the voltage of a bipolar array can be considered the highest voltage between the two conductors in a bipolar subarray provided that, in the event of a ground-fault, the two subarrays are isolated from one another so that their voltages cannot be additive. It is also not needed to state that the Bipolar PV system is isolated from utilization equipment since that is already a requirement in 690.41(B).

Submittal Date: Thu Sep 24 23:27:08 EDT 2015

Committee Statement
Committee Action: Rejected but see related SR
Resolution: SR-938-NFPA 70-2015
Statement: The section was rewritten to better comply with the style manual and to be more understandable. The term "reference ground" is changed to "functional ground" to correlate with the rest of the Code.
Photovoltaic Source Circuit Currents.

The maximum current shall be calculated by one of the following methods:

1. The sum of parallel PV module rated short-circuit currents multiplied by 125 percent.

2. For PV systems with a generating capacity of 100 kilowatts or greater, an industry standard method, performed under engineering supervision, that accounts for the maximum current variables of elevation, array orientation, and irradiance. The calculated maximum current value used by this method shall not be less than 70 percent of the value calculated using 690.8(A)(1) (a). The wire size shall not be smaller than the minimum wire size for the wiring terminal of the equipment, and the minimum wire size based on the product ratings and installation instructions.

Informational Note: One industry standard method for calculating maximum current of a PV system is available from Sandia National Laboratories, reference SAND 2004-3535, Photovoltaic Array Performance Model. This model is used by the System Advisor Model simulation program provided by the National Renewable Energy Laboratory.

Statement of Problem and Substantiation for Public Comment

As written the calculations could result in use of a smaller wire size than is appropriate for the equipment.

We suggest appending the following text to the end of item (2): “The wire size shall not be smaller than the minimum wire size for the wiring terminal of the equipment, and the minimum wire size based on the product ratings and installation instructions.”

Committee Statement

Committee Action: Rejected
Resolution: This valid concern is an issue for all electrical equipment. All electrical terminals have requirements for wire size, CU or AL, number of strands, etc... This PC would necessitate warnings added throughout the Code.
(1) Photovoltaic Source Circuit Currents.

The maximum current shall be calculated by one of the following methods:

(1) The sum of parallel PV module rated short-circuit currents multiplied by 125 percent

(2) For PV systems not mounted on building and with a generating capacity of 100 kilowatts or greater, an industry standard method, performed under engineering supervision, that accounts for the maximum current variables of elevation, array orientation, and irradiance. The calculated maximum current value used by this method shall not be less than 70 percent of the value calculated using 690.8(A)(1) (a)

Informational Note: One industry standard method for calculating maximum current of a PV system is available from Sandia National Laboratories, reference SAND 2004-3535, Photovoltaic Array Performance Model. This model is used by the System Advisor Model simulation program provided by the National Renewable Energy Laboratory.

**Statement of Problem and Substantiation for Public Comment**

SunPower views the addition of 690.8(A)(1)(b) has serious risk for the PV industry. If this adjustment is not calculated correctly, conductors and equipment will overheat because they are carrying more current then they are capable of carrying, which could cause a fire. The situations where this provision is needed are limited. Additionally, there are not well established public resources for the environmental data that would need to be used for this adjustment. Whereas, the ASHRAE handbook provides an established resource for the temperature data needed to apply the Sandia Model to the maximum PV System voltage calculation, the same is not true for maximum irradiance data. As a result the risks associated with this proposal out weigh the advantages. For this reason, SunPower and other members of SEIA opposed introducing this concept into the 2017 NEC and it was not submitted as a SEIA proposal for the First Draft hearing. Since this concept has been introduced and adopted by CMP 4, we recommend that the risk associated with this proposal be limited by not allowing it to be used for PV systems on buildings. This will limit the consequences if this provision is incorrectly used and the mistake causes a fire.

Committee Statement
Committee Action: Rejected but see related SR
Resolution: SR-939-NFPA 70-2015
Statement: The numbering was inconsistent with the style manual.
The panel includes the word “-connected” to modify the word parallel for clarity.
The language related to engineering supervision is revised to more clearly define what an engineer must do to meet this provision. The competency of professional engineers is governed by the licensing boards.
The First Draft recognized the variables of current as irradiance, elevation, and orientation. In the rewording for the SR, it is made clearer that elevation and orientation are modifiers of the local irradiance. Irradiance on the surface of the PV array is what establishes how much current is available.
Public Comment No. 996-NFPA 70-2015 [Section No. 690.8(A)(1)]

(1) Photovoltaic Source Circuit Currents.

The maximum current shall be calculated by one of the following methods:

(1) The sum of parallel PV module rated short-circuit currents multiplied by 125 percent

(2) For PV systems with a generating capacity of 100 kilowatts or greater, an approved industry standard method, performed under engineering supervision, that accounts for, calculates, the maximum current variables of elevation, array orientation, and irradiance 3-hour current based on the simulated irradiance on the PV array. The calculated maximum current value used by this method shall not be less than 70 percent of the value calculated using 690.8(A)(1) (a)

Informational Note: One industry standard method for calculating maximum current of a PV system is available from Sandia National Laboratories, reference SAND 2004-3535, Photovoltaic Array Performance Model. This model is used by the System Advisor Model simulation program provided by the National Renewable Energy Laboratory.

Statement of Problem and Substantiation for Public Comment

This comment clarifies that the maximum current is a 3-hour value that is based on simulated irradiance on the PV array. The variables of elevation and orientation are relevant to current as they adjust the irradiance on the PV array so ultimately irradiance is the only true factor that determines current. Mentioning the other two factors of elevation and orientation may be confusing to AHJs.

The First Draft recognized the variables of current as irradiance, elevation, and orientation. In the rewording for the SR, it is made clearer that elevation and orientation are modifiers of the local irradiance. Irradiance on the surface of the PV array is what establishes how much current is available.
Public Comment No. 1085-NFPA 70-2015 [Section No. 690.8(B)]

(B) Conductor Ampacity.

PV system currents shall be considered to be continuous. Circuit conductors shall be sized to carry not less than the larger of 690.8(B)(1) or (2) or where protected by adjustable electronic overcurrent protection as per 690.9(B) Exception 2, not less than the current in 690.8(B)(3).

(1) One hundred and twenty-five percent of the maximum currents calculated in 690.8(A) before the application of adjustment and correction factors

Exception: Circuits containing an assembly, together with its overcurrent device(s), that is listed for continuous operation at 100 percent of its rating shall be permitted to be used at 100 percent of its rating.

(2) The maximum currents calculated in 690.8(A) after the application of adjustment and correction factors

(3) The rating or setting of the adjustable electronic overcurrent protection in accordance with Art. 240.4

Statement of Problem and Substantiation for Public Comment

Our PI#4744 and PI #4749 were intended to revise the rules for sizing of overcurrent protective devices in PV source and output circuits so that adjustable electronic trip devices could be sized more traditionally (per Art. 240) rather than having to be sized for 125% of the PV short circuit current in the existing 690.9 approach, ensuring they can never trip in the forward direction. While thermal devices such as fuses can be damaged or fail to clear properly when faced with low fault currents, the same is not true of adjustable electronic overcurrent devices. By allowing the rating or setting of such devices in accordance with Art. 240, the devices can provide protection in the forward direction, without risk of being damaged or failing to clear properly, and the devices and the conductors they protect may be made smaller in some situations.

Those PI's were resolved, so we are submitting two related Public Comments: this one on 690.8(B) and a related one on 690.9(B). We feel the intent of the original PI's may not have been clear by the way they were structured, and so these Public Comments attempt to achieve the same objectives in a different way.

Submittal Date: Wed Sep 23 16:16:20 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-940-NFPA 70-2015
Statement: The panel recognizes that electronic overcurrent protective devices are well-suited to PV circuits in that they can react accurately to overload and fault conditions and adequately protect PV output circuit conductors in a PV array. The word “listed” was added in front of “adjustable electronic overcurrent protective devices” to make it clear that non-listed equipment should not be allowed in this type of application. The word “protection” is changed to “protective device” in two
places for consistency with the rest of the Code.
690.9 Overcurrent Protection.

(A) Circuits and Equipment.

PV system dc circuit and inverter output conductors and equipment shall be protected against overcurrent. Overcurrent protection devices are not required for circuits with sufficient ampacity for the highest available current. Circuits connected to current limited supplies (e.g., PV modules, dc-to-dc converters, output circuits) and also connected to sources having higher current availability (e.g., parallel strings of modules, utility power) shall be protected at the higher current source connection.

Exception: An overcurrent device shall not be required for PV modules or PV source circuit or dc-to-dc converters source circuit conductors sized in accordance with 690.8(B) where one of the following applies:

1. There are no external sources such as parallel-connected source circuits, batteries, or backfeed from inverters.
2. The short-circuit currents from all sources do not exceed the ampacity of the conductors and the maximum overcurrent protective device size rating specified for the PV module or dc-to-dc converter.

Informational Note: Photovoltaic system dc circuits are current limited circuits that only need overcurrent protection when connected in parallel to higher current sources. Where necessary, the overcurrent device is installed at the higher current source end of the circuit.

(B) Overcurrent Device Ratings.

Overcurrent devices used in any dc portion of a PV system shall be listed for use in PV systems. Overcurrent device ratings shall be not less than 125 percent of the maximum currents calculated in 690.8(A).

Exception: Circuits containing an assembly, together with its overcurrent device(s), that is listed for continuous operation at 100 percent of its rating shall be permitted to be used at 100 percent of its rating.

(C) Photovoltaic Source and Output Circuits.

A single overcurrent protection device, where required, shall be permitted to protect the PV modules and conductors of each source circuit or the conductors of each output circuit. Where single overcurrent protection devices are used to protect PV source or output circuits, all overcurrent devices shall be placed in the same polarity for all circuits within a PV system. The overcurrent devices shall be accessible but shall not be required to be readily accessible.

Informational Note: Due to improved ground-fault protection required in PV systems by 690.41(B), a single overcurrent protection device in either the positive or negative conductors of a PV system in combination with this ground-fault protection provides adequate overcurrent protection.

(D) Power Transformers.

Overcurrent protection for a transformer with a source(s) on each side shall be provided in accordance with 450.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.

Exception: A power transformer with a current rating on the side connected toward the -interactive inverter output, not less than the rated continuous output current of the inverter, shall be permitted without overcurrent protection from the inverter.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that FR 972 be rewritten to comply with the NEC Style Manual. Wherever the phrase “overcurrent protection device” is used in this subsection rewrite, replace with the phrase “overcurrent protective device.”

(A) Circuits and Equipment.

PV system dc circuit and inverter output conductors and equipment shall be protected against overcurrent. Overcurrent protective devices are not required for circuits with sufficient ampacity for the highest available current. Circuits connected to current limited supplies (e.g., PV modules, dc-to-dc converters, interactive inverter output circuits) and also connected to sources having higher current availability (e.g., parallel strings of modules, utility power) shall be protected at the higher current source connection.

Exception: An overcurrent device shall not be required for PV modules or PV source circuit or dc-to-dc converters source circuit conductors sized in accordance with 690.8(B) where one of the following applies:

1. There are no external sources such as parallel-connected source circuits, batteries, or backfeed from inverters.
2. The short-circuit currents from all sources do not exceed the ampacity of the conductors and the maximum overcurrent protective device size rating specified for the PV module or dc-to-dc converter.

Informational Note: Photovoltaic system dc circuits are current limited circuits that only need overcurrent protection when connected in parallel to higher current sources. Where necessary, the overcurrent device is installed at the higher current source end of the circuit.

Statement of Problem and Substantiation for Public Comment

This comment addresses two issues raised by the correlating committee. The term “protective” device is used instead of protection device. Also, the addition of the words “interactive inverter” to output circuits was part of the FR but inadvertently dropped from the draft. This comment reinstates those words.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-941-NFPA 70-2015
Statement: The term "protective device" is used instead of "protection device" for consistency of terminology. Also, the addition of the words "interactive inverter" to "output circuits" was part of the FR but inadvertently dropped from the draft. This revision reinstates those words.
Public Comment No. 1090-NFPA 70-2015 [Section No. 690.9(B)]

(B) Overcurrent Device Ratings.

Overcurrent devices used in any dc portion of a PV system shall be listed for use in PV systems. Overcurrent device ratings shall be not less than 125 percent of the maximum currents calculated in 690.8(A).

Exception (1): Circuits containing an assembly, together with its overcurrent device(s), that is listed for continuous operation at 100 percent of its rating shall be permitted to be used at 100 percent of its rating.

Exception (2): Adjustable electronic overcurrent protection devices may be rated or set in accordance with Art. 240.4

Statement of Problem and Substantiation for Public Comment

Our PI#4744 and PI #4749 were intended to revise the rules for sizing of overcurrent protective devices in PV source and output circuits so that adjustable electronic trip devices could be sized more traditionally (per Art. 240) rather than having to be sized for 125% of the PV short circuit current in the existing 690.9 approach, ensuring they can never trip in the forward direction. While thermal devices such as fuses can be damaged or fail to clear properly when faced with low fault currents, the same is not true of adjustable electronic overcurrent devices. By allowing the rating or setting of such devices in accordance with Art. 240, the devices can provide protection in the forward direction, without risk of being damaged or failing to clear properly, and the devices and the conductors they protect may be made smaller in some situations.

Those PI's were resolved, so we are submitting two related Public Comments: this one on 690.9(B) and a related one on 690.8(B). We feel the intent of the original PI's may not have been clear by the way they were structured, and so these Public Comments attempt to achieve the same objectives in a different way.

Submittal Date: Wed Sep 23 16:31:34 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-942-NFPA 70-2015
Statement: The newly defined “PV system dc circuit” addresses all the circuits that would require listed PV overcurrent devices.

The exceptions are turned into a list to reduce the number exceptions in Article 690 and to fix style issues.

The panel accepts the addition of the words “and labeled” as originally voted on in the First Revision language.

The new informational note to 690.9(B)(3) clarifies that listed devices can prevent backfeed current.
Public Comment No. 1314-NFPA 70-2015 [Section No. 690.9(B)]

(B) Overcurrent Device Ratings.

Overcurrent devices used in any dc portion of a PV system shall be listed, labeled and identified for use in PV systems. Overcurrent device ratings shall be not less than 125 percent of the maximum currents calculated in 690.8(A).

Exception: Circuits containing an assembly, together with its overcurrent device(s), that is listed and labeled for continuous operation at 100 percent of its rating shall be permitted to be used at 100 percent of its rating.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term "and labeled" was added after "listed" during the First Revision Stage, the words "and labeled" after "listed" be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms "listed" and "labeled," most importantly, to clarify and establish a distinction between the terms "listed" and "labeled" which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of "listed and labeled." As such, UL is submitting comments to request that the words "and labeled" be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer's attestation that the product is in compliance with the appropriate standard. NRTL's conduct factory surveillance of products, surveillance is one method to validate the manufacturer's attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the "Listing" is not impacted, as the "listing" is created at the completion of the "original" certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a "listing" has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, not labeled, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacturer remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that "Only those products bearing the appropriate UL Mark and the company's name, trade name, trademark or other authorized identification should be considered as being covered by UL's Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards." Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Public Comment No. 989-NFPA 70-2015 [Section No. 690.9(B)]

(B) Overcurrent Device Ratings.
Overcurrent devices used in any dc portion of a PV system source circuits shall be listed for use in PV systems. Overcurrent device ratings shall be not less than 125 percent of the maximum currents calculated in 690.8(A).

Exception: Circuits containing an assembly, together with its overcurrent device(s), that is listed for continuous operation at 100 percent of its rating shall be permitted to be used at 100 percent of its rating.

Statement of Problem and Substantiation for Public Comment

Not all dc portions of a renewable energy system is exposed to the special considerations specific to PV source circuits, and listed dc components appropriate for those applications are readily available and have been used successfully and safely for years. The proposed revision acknowledges this, and uses PV source circuits as defined in 690 to clarify that it is the nature of PV source circuits, not merely dc, that triggers the higher requirement to be listed for PV systems.

The new informational note to 690.9(B)(3) clarifies that listed devices can prevent backfeed current.
Public Comment No. 1710-NFPA 70-2015 [Section No. 690.9(C)]

(C) Photovoltaic Source and Output Circuits.
A single overcurrent protection device, where required, shall be permitted to protect the PV modules and conductors of each source circuit or the conductors of each output circuit. Where single overcurrent protection devices are used to protect PV source or output circuits, all overcurrent devices shall be placed in the same polarity for all circuits within a PV system. The overcurrent devices shall be accessible but shall not be required to be readily accessible. For PV systems designed under engineering supervision and not on or in one or two family dwellings, blocking diodes rated for the maximum PV system voltage and for the current required by 690.9(B) shall be permitted as overcurrent protection devices for PV source and output circuits.

Informational Note: Due to improved ground-fault protection required in PV systems by 690.41(B), a single overcurrent protection device in either the positive or negative conductors of a PV system in combination with this ground-fault protection provides adequate overcurrent protection.

Statement of Problem and Substantiation for Public Comment
The OCPD used in PV source and PV output circuits only serve one purpose, to interrupt backfeed current when a fault occurs somewhere between the PV modules and the OCPD. However, the OCPD also needs to be sized to allow the normal operating current to pass through it without activating the OCPD. For a typical PV source circuit, the various derating factors would require that I use a 12A fuse when I have a PV module Isc of 6A. The 12A fuse will not blow until have more than 16 to 20A of fault current flowing through it. As a result, I could feed a fault on a PV source circuit with 6A from the PV modules connected to that string and another 20A from the parallel connected strings forever. This amount of current is more than sufficient to cause a fire. This is not a theoretical concept as there are cases where this situation has already occurred.

A preferred OCPD would allow the device to carry the required current during normal operation conditions and NOT allow any backfeed current to flow through the device during a fault condition. A blocking diode would provide this capability. However, the NEC as written does not allow for blocking diodes to be used as OCPDs. Thus, we propose that 690.9(C) be revised to allow for this superior solution to be implemented. This approach is not new; it has been used in PV systems in Japan for many years. However, we recognize that it would be new in the United States. Thus, we propose that in this code cycle it only be permitted to be used in systems designed under engineering supervision and not in residential systems. This will allow for this solution be used on a limited basis to demonstrate that it will also work well here in the US. In future code cycles, this restriction could be removed.

Resolution: SR-943-NFPA 70-2015
Statement: The revision changes "protection" to "protective" for consistency of terminology.
Public Comment No. 1169-NFPA 70-2015 [Section No. 690.10]

690.10  Stand-Alone Systems.

The premises wiring system shall be adequate to meet the requirements of this Code for a similar installation, connected to a service. The wiring on the supply side of the building or structure disconnecting means shall comply with the requirements of this Code, except as modified by 690.10(A) through (D).

(A) Inverter Output.

The ac output from a stand-alone inverter(s) shall be permitted to supply ac power to the building or structure disconnecting means at current levels less than the calculated load connected to that disconnect. The inverter output rating or the rating of an alternate energy source shall be equal to or greater than the load posed by the largest single utilization equipment connected to the system. Calculated general lighting loads shall not be considered as a single load.

(B) Sizing and Protection.

The circuit conductors between the inverter output and the building or structure disconnecting means shall be sized based on the output rating of the inverter. These conductors shall be protected from overcurrents in accordance with Article 240. The overcurrent protection shall be located at the output of the inverter.

(C) Single 120-Volt Supply.

The inverter output of a stand-alone solar PV system shall be permitted to supply 120 volts to single-phase, 3-wire, 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less than the rating of the neutral bus in the service equipment. This equipment shall be marked with the following words or equivalent:

WARNING
SINGLE 120-VOLT SUPPLY. DO NOT CONNECT MULTI-WIRE BRANCH CIRCUITS!

The warning sign(s) or label(s) shall comply with 110.21(B).

(D) Back-Fed Circuit Breakers.

Plug-in type back-fed circuit breakers connected to the stand-alone output of a stand-alone inverter or multimode inverter shall be secured in accordance with 408.36(D). Circuit breakers marked “line” and “load” shall not be back-fed. PV system shall be installed in accordance with 705.175.

Statement of Problem and Substantiation for Public Comment

This comment removes the content of 690.10 and replaces it with a reference to the new Article 705.175 where the content of 690.10 was moved.

Committee Statement

Committee Action: Rejected but see related SR
Statement: The deleted language is included in the new Article 710.
690.10 Stand-Alone Systems.

The premises wiring system shall be adequate to meet the requirements of this Code for a similar installation connected to a service. The wiring on the supply side of the building or structure disconnecting means shall comply with the requirements of this Code, except as modified by 690.10(A) through (D).

(A) Inverter Output.

The ac output from a stand-alone inverter(s) shall be permitted to supply ac power to the building or structure disconnecting means at current levels less than the calculated load connected to that disconnect. The inverter output rating or the rating of an alternate energy source shall be equal to or greater than the load posed by the largest single utilization equipment connected to the system. Calculated general lighting loads shall not be considered as a single load.

(B) Sizing and Protection.

The circuit conductors between the inverter output and the building or structure disconnecting means shall be sized based on the output rating of the inverter. These conductors shall be protected from overcurrents in accordance with Article 240. The overcurrent protection shall be located at the output of the inverter.

(C) Single 120-Volt Supply.

The inverter output of a stand-alone solar PV system shall be permitted to supply 120 volts to single-phase, 3-wire, 120/240-volt service equipment or distribution panels where there are no 240-volt outlets and where there are no multiwire branch circuits. In all installations, the rating of the overcurrent device connected to the output of the inverter shall be less than the rating of the neutral bus in the service equipment. This equipment shall be marked with the following words or equivalent:

WARNING
SINGLE 120-VOLT SUPPLY. DO NOT CONNECT MULTIWIRE BRANCH CIRCUITS!

The warning sign(s) or label(s) shall comply with 110.21(B).

(D) Energy Storage or Backup Power System Requirements.

Energy storage or backup power supplies are not required.

(E) Back-Fed Circuit Breakers.

Plug-in type back-fed circuit breakers connected to the stand-alone output of a stand-alone inverter or multimode inverter shall be secured in accordance with 408.36(D). Circuit breakers marked “line” and “load” shall not be back-fed.

Statement of Problem and Substantiation for Public Comment

The public input states that (D) was deleted because the content was moved to the definition of a stand-alone system but the change to the definition was rejected by the CMP. (D) should therefore be left in.

The reason (D) was in 690.10 was because some AHJs were requiring storage to be installed on stand-alone systems that did not incorporate storage. Removing this could cause AHJs to start requiring storage on all stand-alone systems again.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacturer remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Buildings whose sole purpose is to house PV system equipment shall not be considered buildings according to this exception.

Statement of Problem and Substantiation for Public Comment
Enphase Energy supports the language proposed by CMP-4 especially at it applies to PV systems operating at 8-ovts or less. This limit is important because without it, intra-module disconnecting means would be required. This technology is not available today.

The removal of the previous list items is important as it described the behavior of the Arc-Fault Circuit Protection device. Description of behavior belongs in the safety standards where they can be adequately described and tested.

Committee Statement
Committee Action: Rejected but see related SR
Resolution: SR-945-NFPA 70-2015
Statement: The correlating committee comment requested a relook at the comments from the First Revision language. Bipolar systems are addressed by the addition of “between any two conductors”.

The terms related to listing and labeling were returned to the first revision language.
690.12 Rapid Shutdown of PV Systems on Buildings.

PV system circuits installed on or in buildings shall include a rapid shutdown in accordance with 690.12 (A) through (E).

(A) Controlled Conductors.

Requirements for controlled conductors shall apply to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

1. Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

2. Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

(C) Initiation Device.

Where multiple PV systems are installed on a single service, a single device shall initiate the rapid shutdown of all PV systems on that service. Additional auxiliary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted. The rapid shutdown initiation device shall comply with one of the following:

1. Where the PV system is connected in accordance with 705.12(D) and rapid shutdown initiates upon loss of voltage from the utility, the service disconnecting means shall be the initiation device.

2. Where the PV system is connected in accordance with 705.12(A) and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

3. Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible and clearly indicate whether the PV system is “off” or “on.” The initiation device shall be lockable in the “off” position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation where conductors are not controlled upon loss of voltage from the utility.

(D) Manually Reset.

When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

(E) Equipment.

Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed, labeled, and identified for providing rapid shutdown protection.

(F) Marking.

1. The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

   RAPID SHUTDOWN PV SYSTEM DISCONNECT

2. If a rapid shutdown initiation device is not located near the service disconnecting means, a sign shall be installed at the service disconnecting means location, identifying the location of the initiation device.

Exception: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.

Statement of Problem and Substantiation for Public Comment

I support FR 1008 to reduce the voltage within a rooftop PV array. This will ensure that fire service personnel do not become injured by accidentally coming into contact with a damaged PV array.

690.12 Rapid Shutdown of PV Systems on Buildings.

PV system circuits installed on or in buildings shall include a rapid shutdown in accordance with 690.12 (A) through (E).

(A) Controlled Conductors.

Requirements for controlled conductors shall apply to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2) Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

(C) Initiation Device.

Where multiple PV systems are installed on a single service, a single device shall initiate the rapid shutdown of all PV systems on that service. Additional auxiliary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted. The rapid shutdown initiation device shall comply with one of the following:

(1) Where the PV system is connected in accordance with 705.12(D) and rapid shutdown initiates upon loss of voltage from the utility, the service disconnecting means shall be the initiation device.

(2) Where the PV system is connected in accordance with 705.12(A) and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

(3) Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible and clearly indicate whether the PV system is "off" or "on." The initiation device shall be lockable in the "off" position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation where conductors are not controlled upon loss of voltage from the utility.

(D) Manually Reset.

When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

(E) Equipment.

Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed, labeled, and identified for providing rapid shutdown protection.

(F) Marking.

(1) The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

RAPID SHUTDOWN PV SYSTEM DISCONNECT

(2) If a rapid shutdown initiation device is not located near the service disconnecting means, a sign shall be installed at the service disconnecting means location, identifying the location of the initiation device.

Exception: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.

Statement of Problem and Substantiation for Public Comment

I support the proposed first revision language. Manual fire fighting efforts are necessary to control roof level fires for roof mounted PV arrays. PV arrays are expected to last over 20 years, with exposure to weather and natural hazards, and potentially minimal maintenance. The level of voltage output from PV assemblies must be reduced to allow safe and effective emergency response.

690.12 Rapid Shutdown of PV Systems on Buildings.

PV system circuits installed on or in buildings shall include a rapid shutdown function to reduce shock hazard for emergency responders, in accordance with 690.12 (A) through (E). (D).

(A) Controlled Conductors.

Requirements for controlled conductors shall apply only to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to outside the array boundary shall comply with 690.12(B)(1) and inside the array boundary shall comply with 690.12(B)(2).

1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

Controlled

1) Rapid shutdown equipment shall be installed to limit firefighter exposure to electrical hazards from the controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

1) Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown

Informational Note: The designation PV Equipment Safe for Proximity Fire Fighting identifies equipment and components that limit firefighter exposure to an electrical hazard within the array boundary after the Rapid Shutdown initiator has been activated. This designation addresses single point failures that might occur when the PV system is inadvertently damaged by firefighting operations or other mechanical damage or during a building fire. Control of electric shock hazard may be achieved by methods such as limiting access to exposed components that might become energized, reducing the potential difference between energized components, limiting the electric current that might flow in an electrical circuit involving personnel with increased resistance of the conductive circuit, or by a combination of such methods.
Initiation Device.

Where multiple PV systems are installed on a single service, a single device initiating all PV systems on that service shall initiate the rapid shutdown function of the PV system. The device "off" position shall indicate that the rapid shutdown function has been initiated. For one-family and two-family dwellings an initiation device(s) shall be located at a readily accessible location outside the building.

The rapid shutdown initiation device shall comply with devices shall consist of at least, one of the following:

1. Service disconnecting means.
2. PV system disconnecting means.
3. Readily accessible switch that plainly indicates whether the device is in the "off" or "on" position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation where conductors are not controlled that remains energized upon loss of utility voltage from the utility.

(D) Manually Reset.

When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

Where multiple PV systems are installed with rapid shutdown functions on a single service, the initiation device(s) shall consist of not more than six switches or six sets of circuit breakers, or a combination of not more than six switches and sets of circuit breakers, mounted in a single enclosure, or in a group of separate enclosures. These initiation device(s) shall initiate the rapid shutdown of all PV systems with rapid shutdown functions on that service. Additional auxiliary initiation devices, installed in accordance with rapid shutdown equipment listings, shall be permitted.

(E) Equipment.

(2) Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed and labeled for providing rapid shutdown protection.

(F) Marking.

(1) The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

RAPID SHUTDOWN PV SYSTEM DISCONNECT

If a rapid shutdown initiation device is not located near the service disconnecting means, a sign shall be installed at the service disconnecting means location, identifying the location of the initiation device.

Rapid shutdown equipment not meeting the requirements of 690.12(B)(2) shall be labeled Rapid Shutdown Equipment for PV.

Informational Note: Inverter input circuit conductors can remain energized for up to 15 minutes with inverters not listed for rapid shutdown.

Exception: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.

Additional Proposed Changes

Statement of Problem and Substantiation for Public Comment

These proposed revisions to 690.12, and 690.12(B)(2) in particular, are intended to enhance electrical protection within the array and significantly increase the safety of fire fighters working on roofs with PV equipment.

In order to measure an increase in safety, there should be a baseline for comparison. The number of PV-related fatalities of first responders is zero. According to the National Institute for Occupational Safety and Health database, between 1984 and 2013, there have been seven first responder deaths due to electrocution, and all were related to AC medium-voltage overhead or downed power lines. Not a single one was related to DC voltage from a PV array.
Committee Statement

Looking at the details of the first draft of 2017 NEC, it is not clear that the suggested 80V limit will result in an increase in first responder usage of a specific PV technology with a questionable effect on safety. The 80V limit is somewhat arbitrary and was chosen primarily because it is greater than most modules’ maximum voltage rather than corresponding to a recognized safety limit. It is also, coincidentally, the threshold at which module level electronics manufacturers can comply using currently available solutions. Additionally, UL 62109-1 and 2014 NEC outline 240VA as the safe limit (energy hazard), which is a lower power level than many modules in the market today.

As is often the case with the evolution of PV, we can look to European markets to offer some level of experience and guidance. A German study conducted by the Federal Ministry for Economic Affairs & Energy, TÜV Rheinland, and Fraunhofer was completed in March 2015 and titled “Assessment of the Fire Risk in Photovoltaic Systems and Elaboration of Safety Concepts for Minimization of Risks.” The study concluded that PV systems do not pose any particular threat to fire department personnel, provided they comply with safety clearances just as with any other live electrical equipment. Moreover, the vast majority of European PV systems do not utilize module-level electronics and there has never been a governing body that has enforced a code mandating module-level shutdown.

An additional report issued by Fraunhofer, Europe’s largest application-oriented research organization, was completed in May 2015 and titled “Recent Facts about Photovoltaics in Germany.” The report offered updated statistics regarding first responder safety and revealed a considerably successful record. With more than 1.4 million PV plants installed in Germany, to date no firefighter has been injured by PV power while putting out a fire. This significant fact becomes even more telling when you consider it was achieved in a market that does not mandate rapid shutdown at all, let alone module-level shutdown. The report goes on to state, “Comprehensive training courses for the fire brigade could eliminate any uncertainties firefighters may have. As with every electrical installation, it is possible to extinguish a fire using water from a distance of one to five meters. Based on investigations to date, all of the claims stating that the fire brigade could not extinguish a house fire due to the PV system have been found to be false.”

One must also look at the experience in the Australian market with very stringent requirements on generator shutdown put into force in 2012. Australia has today not only a leading role in the sheer numbers of PV installations but also in PV related fires. According to a report on metrosolar.com.au, as of November 2014, there have been more than 167 fires in Queensland alone, all related to the mandatory rooftop DC isolator.

An additional report issued by Fraunhofer, Europe’s largest application-oriented research organization, was completed in May 2015 and titled “Recent Facts about Photovoltaics in Germany.” The study concluded that PV systems do not pose any particular threat to fire department personnel, provided they comply with safety clearances just as with any other live electrical equipment. Moreover, the vast majority of European PV systems do not utilize module-level electronics and there has never been a governing body that has enforced a code mandating module-level shutdown.

Looking at the full picture, it turns out that there is no imminent need for a change of existing codes and procedures. It even shows, that adding an extra layer of complexity such as the mandatory DC isolators in Australia, might even increase the number of incidents and thus reduce the level of safety significantly, adding additional risk to every PV installation. One must conclude that every piece of equipment in a PV installation – especially if intended for an additional layer of safety – will have to be thoroughly specified and tested according to established standards.

As of today, there is no existing universal standard qualifying PV Equipment Safe for Proximity Fire Fighting. This standard still needs to be defined. It should account for the existing international experiences, defining a general safety objective, and shall not mandate the usage of a specific PV technology with a questionable effect on safety.

Looking at the details of the first draft of 2017 NEC, it is not clear that the suggested 80V limit will result in an increase in first responder safety. The 80V limit is somewhat arbitrary and was chosen primarily because it is greater than most modules’ maximum voltage rather than corresponding to a recognized safety limit. It is also, coincidentally, the threshold at which module level electronics manufacturers can comply using currently available solutions.

According to UL 1310, the safe voltage in dry conditions is 60V and 30V in wet conditions (also 2014 NEC Chapter 9, Table 11(B)). Additionally, UL 62109-1 and 2014 NEC outline 240VA as the safe limit (energy hazard), which is a lower power level than many modules in the market today.

The first draft of 2017 NEC removes the 240VA reference, while introducing an 80V limit. If first responders need to cut a hole in a roof and come into contact with a module, then they would potentially be exposing themselves to a higher voltage than prescribed by UL or current NEC. Even though the wiring between modules may not be live, the modules will remain energized. To cut through a roof in an area where PV exists would mean chopping through a module, potentially giving module power a path to ground and exposing firefighters to more than 300VA.

Furthermore, trusting rapid shutdown to reliably work without taking other personal safety measures could lead to perceived safety and a false sense of security. Therefore, there still needs to be a keep out zone for first responder guidance. If there is reason to get on the roof at all, it is also best to stay in the walkways and keep a safe clearance from the array. Thus, the proposed change in the first draft of 2017 NEC, 690.12 will not improve the safety of rooftop PV systems, but will only achieve an increase in system complexity, cost, maintenance, and add new risks.

Committee Statement
<table>
<thead>
<tr>
<th>Committee Action:</th>
<th>Rejected but see related SR</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resolution:</td>
<td>This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(2)(b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.</td>
</tr>
</tbody>
</table>

A section-by-section summary of the changes are described below.

**Main paragraph:**

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment” for consistency of terminology.

**Section (A):**

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

**Section (B):**

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a section for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

**Section (C):**

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.
Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
Public Comment No. 1266-NFPA 70-2015 [Section No. 690.12]

690.12  Rapid Shutdown of PV Systems on Buildings.
PV system circuits installed on or in buildings shall include a rapid shutdown in accordance with 690.12 (A) through (E).

A  Controlled Conductors.
Requirements for controlled conductors shall apply to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

B  Controlled Limits.
The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

2) Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

C  Initiation Device.
Where multiple PV systems are installed on a single service, a single device shall initiate the rapid shutdown of all PV systems on that service. Additional auxiliary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted. The rapid shutdown initiation device shall comply with one of the following:

1) Where the PV system is connected in accordance with 705.12(D) and rapid shutdown initiates upon loss of voltage from the utility, the service disconnecting means shall be the initiation device.

2) Where the PV system is connected in accordance with 705.12(A) and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

3) Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible and clearly indicate whether the PV system is “off” or “on.” The initiation device shall be lockable in the “off” position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation where conductors are not controlled upon loss of voltage from the utility.

D  Manually Reset.
When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

E  Equipment.
Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed, labeled, and identified for providing rapid shutdown protection.

F  Marking.

1) The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

RAPID SHUTDOWN PV SYSTEM DISCONNECT

2) If a rapid shutdown initiation device is not located near the service disconnecting means, a sign shall be installed at the service disconnecting means location, identifying the location of the initiation device.

Exception: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.

Statement of Problem and Substantiation for Public Comment
I support this effort to reduce the voltage within the array in an emergency. The lower voltage will greatly reduce possibility of personnel injury in an emergency.

690.12  Rapid Shutdown of PV Systems on Buildings.

PV system circuits installed on or in buildings shall include a rapid shutdown function to reduce shock hazard for emergency responders, in accordance with 690.12 (A) through (E).

Exception: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.

(A) Controlled Conductors.

Requirements for controlled conductors shall apply to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors outside the array boundary shall apply to 690.12(B)(1) and inside the array boundary shall comply with 690.12(B)(2).

1. Outside the array boundary. Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

2. Inside the array boundary. The PV system shall comply with (a) or (b):

   (a) The PV array is listed and labeled as a rapid shutdown PV array. Such a PV array is installed and used in accordance with the instructions included with the rapid shutdown PV array listing and labeling or field labeling.

      Informational Note: A listed or labeled or field labeled rapid shutdown PV array is evaluated to provide an equivalent or lower shock hazard exposure as that provided by 690.12(B)(2)(b).
(b) Controlled conductors located inside the boundary or less not more than 1 m (3 ft) from the point of entry inside a penetration of the surface of the building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

This requirement

The requirement of 690.12(B)(2)(b) shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

(C) Initiation Device.

Where multiple PV systems are installed on a single service, a single device that connected to that service. Additional auxiliary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted.

device. For one-family and two-family dwellings, an initiation device(s) shall be located at a readily accessible location outside the building.

The rapid shutdown initiation device(s) shall comply with. (s) shall consist of at least one of the following:

1. Where the PV system is connected in accordance with, 705.12(D) and rapid shutdown initiates upon loss of voltage from the utility, the service disconnecting means shall be the initiation device.

2. Where the PV system is connected in accordance with, 705.12(A) and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible and clearly indicate whether the PV system is "off" or "on."

3. Service disconnecting means,

4. PV system disconnecting means.

5. Readily accessible switch that plainly indicates whether it is in the "off" or "on" position. The initiation device shall be lockable in the "off position."

Informational Note: - One example of why an initiation device that complies with 690.12(C)(3) would apply to, for example, be used is where a PV system with standby operation where conductors are not controlled, is connected to an optional standby system that remains energized upon loss of utility voltage, from the utility.

(D) Manually Reset.

When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

(E) Where multiple PV systems are installed with rapid shutdown functions on a single service, the initiation device(s) shall consist of not more than six switches or six sets of circuit breakers, or a combination of not more than six switches and sets of circuit breakers, mounted in a single enclosure, or in a group of separate enclosures. These initiation device(s) shall initiate the rapid shutdown of all PV systems with rapid shutdown functions on that service. Where auxiliary initiation devices are installed, these auxiliary devices shall control all PV systems with rapid shutdown functions on that service.

(E) Equipment.

Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed.

- and labeled
- and identified

for providing rapid shutdown protection.

(F) Marking.
The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

Rapid Shutdown PV System Disconnect

2. If a rapid shutdown initiation device is not located near the service disconnecting means, a sign shall be installed at the service disconnecting means location, identifying the location of the initiation device.

Exception: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.

Informational Note: Inverter input circuit conductors often remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

Statement of Problem and Substantiation for Public Comment

This comment on the first revision is a product of the NFPA Fire Fighter Safety and PV Systems Task Group that has been involved in an ongoing dialogue since December 2014 that includes this recommended language for the 2017 version of 690.12. This Task Group is made up of over 20 participants from Code Making Panel 4, the solar industry, the fire service, the insurance industry, test laboratories, and other relevant stakeholders.

A section-by-section summary of the recommended changes are described below.

Main paragraph:
Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

Section (A):
This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off.

Section (B):
This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80Volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):
The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under
development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the "off" position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):
This section was removed since the three initiator options are all switches that have an "on" or "off" position. The new clarified wording requires that an initiator in the "off" position requires that the PV system be in the rapid shutdown mode. If not initiators are turned "off" and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the "off" position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):
The word identified was changed to "labeled" since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):
The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.

Committee Statement

Committee Action: Accepted
Resolution: SR-7502-NFPA 70-2015
Statement: This comment on the first revision is a product of the NFPA Fire Fighter Safety and PV Systems Task Group that has been involved in an ongoing dialogue since December 2014 that includes this recommended language for the 2017 version of 690.12. This Task Group is made up of over 20 participants from Code Making Panel 4, the solar industry, the fire service, the insurance industry, test laboratories, and other relevant stakeholders.

A section-by-section summary of the recommended changes are described below.

Main paragraph:

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary.
Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for three methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80Volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will address these concerns. The second option allows for a prescriptive solution that limits the voltage in the PV array to 80 volts, consistent with the first draft language. The third option is to allow a PV array that has no exposed wire, no exposed metal, and is far enough from grounded parts to prevent contact with the array and ground.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
690.12 Rapid Shutdown of PV Systems on Buildings.

PV system circuits installed on or in buildings shall include a rapid shutdown in accordance with 690.12 (A) through (E).

(A) Controlled Conductors.

Requirements for controlled conductors shall apply to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2) Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

(C) Initiation Device.

Where multiple PV systems are installed on a single service, a single device shall initiate the rapid shutdown of all PV systems on that service. Additional auxiliary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted. The rapid shutdown initiation device shall comply with one of the following:

(1) Where the PV system is connected in accordance with 705.12(D) and rapid shutdown initiates upon loss of voltage from the utility, the service disconnecting means shall be the initiation device.

(2) Where the PV system is connected in accordance with 705.12(A) and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

(3) Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible and clearly indicate whether the PV system is "off" or "on." The initiation device shall be lockable in the "off" position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation where conductors are not controlled upon loss of voltage from the utility.

(D) Manually Reset.

When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

(E) Equipment.

Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed, labeled, and identified for providing rapid shutdown protection.

(F) Marking.

(1) The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

RAPID SHUTDOWN PV SYSTEM DISCONNECT

(2) If a rapid shutdown initiation device is not located near the service disconnecting means, a sign shall be installed at the service disconnecting means location, identifying the location of the initiation device.

Exception: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.

Statement of Problem and Substantiation for Public Comment

Representing fire fighters, I support the effort to shut down PV systems to the module level during emergencies. The recent proliferation of solar systems in our jurisdiction is having an impact on fire fighter's ability to respond to fire emergencies. Access and egress and egress during roof top operations and the inability to control utilities for the entire structure are concerns. It is vital that the code development process recognizes the need to protect fire fighter safety. This proposal utilizes existing technology to do just that.

690.12 Rapid Shutdown of PV Systems on Buildings.

PV system circuits installed on or in buildings shall include a rapid shutdown in accordance with 690.12 (A) through (E).

(A) Controlled Conductors.

Requirements for controlled conductors shall apply to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2) Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

(C) Initiation Device.

Where multiple PV systems are installed on a single service, a single device shall initiate the rapid shutdown of all PV systems on that service. Additional auxiliary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted. The rapid shutdown initiation device shall comply with one of the following:

(1) Where the PV system is connected in accordance with 705.12(D) and rapid shutdown initiates upon loss of voltage from the utility, the service disconnecting means shall be the initiation device.

(2) Where the PV system is connected in accordance with 705.12(A) and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

(3) Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible and clearly indicate whether the PV system is “off” or “on.” The initiation device shall be lockable in the “off” position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation where conductors are not controlled upon loss of voltage from the utility.

(D) Manually Reset.

When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

(E) Equipment.

Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed, labeled, and identified for providing rapid shutdown protection.

(F) Marking.

(1) The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

RAPID SHUTDOWN PV SYSTEM DISCONNECT

(2) If a rapid shutdown initiation device is not located near the service disconnecting means, a sign shall be installed at the service disconnecting means location, identifying the location of the initiation device.

Exception: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.

Statement of Problem and Substantiation for Public Comment

Fire Marshals Association of Colorado supports the language in the First Revision as well as the work from the Firefighter Safety and PV System Task Group. PV system on rooftops can present a several hazards to firefighters, the most serious is electric shock in an emergency situation. This section and the proposed change is a significant step forward in improving firefighter safety.

Committee Statement

Committee Action: Rejected
Resolution: No changes were recommended by the submitter.
Public Comment No. 1408-NFPA 70-2015 [Section No. 690.12]

690.12 Rapid Shutdown of PV Systems on Buildings.

PV system circuits installed on or in buildings shall include a rapid shutdown function to reduce shock hazard for emergency responders, in accordance with 690.12 (A) through (E).
(A) Controlled Conductors.

Requirements for controlled conductors shall apply only to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors outside the array boundary shall apply with 690.12(B)(1) and, inside the array boundary shall comply with 690.12(B)(2).

1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 to 30 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

2) Rapid shutdown equipment shall be installed to limit firefighter exposure to electrical hazards from the controlled conductors located inside the array boundary and shall be listed and labeled as PV Equipment Safe for Proximity Fire Fighting. Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

Informational Note: The designation PV Equipment Safe for Proximity Fire Fighting identifies equipment and components that limit firefighter exposure to an electrical hazard within the array boundary after the Rapid Shutdown initiator has been activated. This designation addresses single point failures that might occur when the PV system is inadvertently damaged by firefighting operations or other mechanical damage or during a building fire. Control of electric shock hazard may be achieved by methods such as limiting access to exposed components that might become energized, reducing the potential difference between energized components, limiting the electric current that might flow in an electrical circuit involving personnel with increased resistance of the conductive circuit, or by a combination of such methods.

This requirement of 690.12(B)(2), shall become effective January 1, 2020, 2018.

Informational Note:

Inverter: Inverter, input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

(C) Initiation Device.

The initiation device(s) shall initiate the rapid shutdown function of the PV system. The device “off” position shall indicate that the rapid shutdown function has been initiated. For one-family and two-family dwellings an initiation device(s) shall be located at a readily accessible location outside the building. Where multiple PV systems are installed on a single service, a single device shall initiate the rapid shutdown of all PV systems on that service. Additional auxiliary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted. The rapid shutdown initiation device(s) shall consist of at least one of the following:

1) Where the PV system is connected in accordance with 705.12(D), and rapid shutdown initiates upon loss of voltage from the utility, the

   (1) Service disconnecting means shall be the initiation device.

   (2) Where the PV system is connected in accordance with 705.12(A), and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

   (3) Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible. The initiation device(s) shall be lockable in the “off” position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation that remains energized where conductors are not controlled, upon loss of utility voltage from the utility.

Where multiple PV systems are installed with rapid shutdown functions on a single service, the initiation device(s) shall consist of not more than six switches or six sets of circuit breakers, or a combination of not more than six switches and sets of circuit breakers, mounted in a single enclosure, or in a group of separate enclosures. These initiation device(s) shall initiate the rapid shutdown of all PV systems with rapid shutdown functions on that service. Additional auxiliary initiation devices, installed in accordance with rapid shutdown equipment listings, shall be permitted.

1) Manually Reset.

When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

2) Equipment.

Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed, and labeled, and identified, for providing rapid shutdown protection.

Rapid shutdown equipment not meeting the requirements of 690.12(B)(2) shall be labeled Rapid Shutdown Equipment for PV.

Informational Note: Inverter input circuit conductors can remain energized for up to 15 minutes with inverters not listed for rapid shutdown.
Additional Proposed Changes

Statement of Problem and Substantiation for Public Comment

These proposed revisions to 690.12, and 690.12(B)(2) in particular, are intended to enhance electrical protection within the array and significantly reduce the risk of accidental shock to fire fighters. Importantly, SEIA understands and largely agrees with the Fire Service's intent to further enhance rapid shutdown requirements in the 2017 NEC. SEIA disagrees, however, with the specific requirement limits that have been aggressively promoted during this revision cycle and adopted by the NFPA's Fire Fighter Safety Task Group (Task Group). The incorporation of these limits into the NEC would effectively mandate module level electronics, resulting in a variety of negative consequences. SEIA is also opposed to the creation of two options for compliance, as this will likely create two distinct and different levels of safety and performance based on which compliance method the installing contractor selects. In SEIA's view, the 2017 NEC requirement for improving PV electrical safety for fire fighters should focus solely on the development of a new PV Equipment Safe for Proximity Fire Fighting standard and related equipment labeling.

SEIA's proposal is intended to address fire service safety concerns without the negative effects of prescribing a specific product technology. Reliance on a specific technology would, in SEIA's view, increase safety risks to service personnel, stifle innovation of potentially more effective rapid shutdown technologies, and decrease the value of solar PV to the consumer. Importantly, although SEIA strongly disagrees with the Task Group's proposal for a module level electronics mandate, SEIA accepts nearly all of the other proposed changes agreed upon by the Task Group. SEIA's proposed language, therefore, largely tracks the Task Group’s most recent language, with one obvious exception.

SEIA's strong contention is that, given the absence of any independent technical justification for the proposed module level electronics mandate, it is inappropriate for the NFPA to set voltage requirements within the array equipment. Indeed, the NFPA would be setting an arbitrary level of safety based solely on statements from a few existing product manufacturers and not fact-based testing involving a wide selection of performance criteria. Indeed, it would be unprecedented for the NFPA to adopt a code change of this magnitude without any independent technical justification. SEIA believes that the product safety standard development process is the only appropriate path for limits, such as acceptable voltage, to be explored and documented.

Using existing live electrical fire fighting methods and well-documented techniques, fire fighters are able to safely perform fire-fighting operations involving PV arrays. But as with nearly any product involving electricity, there are always opportunities to make safety improvements, particularly when new safety-related technologies become available. Indeed, the three-year code development cycle speaks to the need to continuously update and improve the NEC. The NFPA has also consistently recognized that improvements to the code must be adopted on an incremental basis.

In contrast, if the proposed language from the Task Group is accepted by the CMP without revision, the NFPA would be codifying the wholesale adoption of module level electronic technology over a single code cycle, and would be doing this in advance of any product safety standard or long-term product field testing for this new requirement. In its haste to address the legitimate concerns of several important stakeholders, the NFPA risks a variety of unintended, and significantly adverse, consequences.

There are multiple approaches to significantly reduce the risk of shock hazard to fire fighters operating within the PV array boundary. In contrast, a module level electronics mandate would favor certain technologies over others. This is an overly prescriptive approach which will create a disincentive to develop competing technologies and stifle innovation. It should also be recognized that nearly all module level electronic devices being sold today are principally designed for power conversion and monitoring—not rapid shutdown.

The long-term reliability of module level electronics is also relatively unproven. Indeed, few devices currently being sold for module level rapid shutdown have undergone long-term reliability testing in the field. In addition, rapid shutdown devices used within the array boundary must endure harsh environments, e.g., operating temperatures up to 190 degrees °F, humidity, and corrosion. These devices are also subject to large daily temperature cycles, which, pursuant to Sandia National Laboratories, result in increased stress on componentry and more difficult thermal management. Module level electronics also incorporate a variety of sophisticated semiconductor-based components and printed circuit board assemblies, which are particularly susceptible to high temperatures. Given
these risks, the better approach is to subject all rapid shutdown solutions to the rigors of long-term reliability testing before the wholesale adoption of any one technology.

Reliability is not only a concern for fire fighters but also for PV service personnel exposed to the inherent hazards of roof work. The concern here is that unreliable rapid shutdown devices will significantly, and unnecessarily, increase the amount of time PV installers and electricians spend on rooftops to replace or repair failed devices. And while PV installers and electricians recognize and accept the inherent risks of rooftop environments, no one should have to accept unnecessary exposure to such hazards.

Based on the foregoing, further improvements to 690.12 through the adoption of a PV Equipment Safe for Proximity Fire Fighting standard is the prudent approach. To allow adequate time for the development of this standard, it is essential that the effective date of subsection 690.12(B)(2) be deferred until January 1, 2020. Delayed enforcement is supported by a realistic assessment of the standards development process, recent experience with the 2014 NEC, and NFPA precedent on AC arc fault circuit interrupters (AFCI).

With respect to the 2014 NEC, while rapid shutdown requirements are starting to be implemented at the state-level, a rapid shutdown standard has not yet been adopted. SEIA recognizes that the necessary revisions are being made to UL 1741 to include a rapid shutdown standard consistent with the 2014 NEC but this new language will not be released until mid-2016, and this release date assumes the current standards development process remains on track. As a result, it will be the end of 2016 before products are listed to this standard and installed in the field, a full three years after the 2014 NEC was first published.

Delayed enforcement is also supported by NFPA precedent. For example, AFCI requirements were first published in the 1999 version of the NEC with a delayed enforcement date of Jan 1, 2002. Deferment will also allow for additional field testing of rapid shutdown equipment before final adoption of the 2020 NEC.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(2). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.

A section-by-section summary of the changes are described below.

Main paragraph:

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change "PV power generating equipment" to "PV system equipment" for consistency of terminology.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker
is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
### Public Comment No. 1410-NFPA 70-2015 [ Section No. 690.12 ]

**690.12 Rapid Shutdown of PV Systems on Buildings.**

PV system circuits installed on or in buildings shall include a rapid shutdown in accordance with 690.12 (A) through (E).

(A) **Controlled Conductors.**

Requirements for controlled conductors shall apply to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

(B) **Controlled Limits.**

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2) Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

(C) **Initiation Device.**

Where multiple PV systems are installed on a single service, a single device shall initiate the rapid shutdown of all PV systems on that service. Additional auxiliary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted. The rapid shutdown initiation device shall comply with one of the following:

(1) Where the PV system is connected in accordance with 705.12(D) and rapid shutdown initiates upon loss of voltage from the utility, the service disconnecting means shall be the initiation device.

(2) Where the PV system is connected in accordance with 705.12(A) and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

(3) Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible and clearly indicate whether the PV system is "off" or "on." The initiation device shall be lockable in the "off" position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation where conductors are not controlled upon loss of voltage from the utility.

(D) **Manually Reset.**

When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

(E) **Equipment.**

Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed, labeled, and identified for providing rapid shutdown protection.

(F) **Marking.**

(1) The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

**RAPID SHUTDOWN PV SYSTEM DISCONNECT**

(2) If a rapid shutdown initiation device is not located near the service disconnecting means, a sign shall be installed at the service disconnecting means location, identifying the location of the initiation device.

*Exception: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.*

### Statement of Problem and Substantiation for Public Comment

I support this first revision language for multiple reasons. 1) Dietz and Watson fire - this is a very strong example of a catastrophe created whereby the fire fighters could not pro-actively interact with a solar array to engage a rooftop fire using standard fire fighting practices. A very large and un-necessary property loss was the result. 2) There is no other appliance allowed to be used in and around populated areas, where there is not a clearly designated switch, plug or other de-energizing method for fully de-activing the system -
why should solar be any different? This industry inconsistency results in an even greater hazard to those untrained in solar, as the default expectation is that such that all electrical systems can be turned off and are fundamentally safe. 3) There is an increasing focus on reducing the cost of distributed energy by increasing the power and energy density of arrays. As part of increasing the rooftop power density, there is a critical need to be able to confidently and fully de-energize a solar array such that first responders can pro-actively engage directly with the PV array and roof areas as needed (such as quickly breaking out modules to increase access, roof venting, etc., and unless the array is de-energized to a safe level this is not possible).

The only remaining concern about the first revision as written, would be to dis-allow “radio frequency” or “power-line carrier” based devices or other remote based devices as an initiation device, given the inherent and un-reliable nature of these devices and the inability to confirm they operated successfully during a fire event (and were not damaged by the fire prior to being activated). There is only one thing worse than a known exposed electrical hazard to a fire fighter -and that is one where the fire fighter believes the hazard has been deactivated - when in fact they have not.

**Committee Statement**

Committee Action: Rejected  
Resolution: No changes were recommended by the submitter.
690.12  Rapid Shutdown of PV Systems on Buildings.

PV system circuits installed on or in buildings shall include a rapid shutdown in accordance with 690.12 (A) through (E).

(A)  Controlled Conductors.

Requirements for controlled conductors shall apply to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

(B)  Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

(1)  Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2)  Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

(C)  Initiation Device.

Where multiple PV systems are installed on a single service, a single device shall initiate the rapid shutdown of all PV systems on that service. Additional auxilary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted. The rapid shutdown initiation device shall comply with one of the following:

(1)  Where the PV system is connected in accordance with 705.12(D) and rapid shutdown initiates upon loss of voltage from the utility, the service disconnecting means shall be the initiation device.

(2)  Where the PV system is connected in accordance with 705.12(A) and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

(3)  Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible and clearly indicate whether the PV system is “off” or “on.” The initiation device shall be lockable in the “off” position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation where conductors are not controlled upon loss of voltage from the utility.

(D)  Manually Reset.

When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

(E)  Equipment.

Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed, labeled, and identified for providing rapid shutdown protection.

(F)  Marking.

(1)  The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

RAPID SHUTDOWN PV SYSTEM DISCONNECT

(2)  If a rapid shutdown initiation device is not located near the service disconnecting means, a sign shall be installed at the service disconnecting means location, identifying the location of the initiation device.

Informational Note: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.

Statement of Problem and Substantiation for Public Comment

i support reducing the voltage within the array during an emergency

Committee Statement

Committee Action: Rejected
Resolution: No changes were recommended by the submitter.
690.12 Rapid Shutdown of PV Systems on Buildings.

PV system circuits installed on or in buildings shall include a rapid shutdown function to reduce shock hazard for emergency responders, in accordance with 690.12(A) through (E).

(A) Controlled Conductors.

Requirements for controlled conductors shall apply only to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply outside the array boundary shall comply with 690.12(B)(1) and inside the array boundary shall comply with 690.12(B)(2).

1. Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 to 30 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

2. Controlled rapid shutdown equipment shall be installed to limit firefighter exposure to electrical hazards from the controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown and shall be listed and labeled as PV Equipment Safe for Proximity Fire Fighting.

Informational Note: The designation PV Equipment Safe for Proximity Fire Fighting identifies equipment and components that limit firefighter exposure to an electrical hazard within the array boundary after the Rapid Shutdown initiator has been activated. This designation addresses single point failures that might occur when the PV system is inadvertently damaged by firefighting operations or other mechanical damage or during a building fire. Control of electric shock hazard may be achieved by methods such as limiting access to exposed components that might become energized, reducing the potential difference between energized components, limiting the electric current that might flow in an electrical circuit involving personnel with increased resistance of the conductive circuit, or by a combination of such methods.

This requirement of 690.12(B)(2) shall become effective January 1, 2020.

(C) Initiation Device.

Where multiple PV systems are installed on a single service, a single device shall initiate the rapid shutdown function of all PV systems on that service. Additional auxiliary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted by the PV system. The device “off” position shall indicate that the rapid shutdown function has been initiated. For one-family and two-family dwellings an initiation device(s) shall be located at a readily accessible location outside the building. The rapid shutdown initiation device shall comply with (s) shall consist of at least one of the following:

1. Where the PV system is connected in accordance with 705.12(D) and rapid shutdown initiates upon loss of voltage from the utility, the service disconnecting means shall be the initiation device.

2. Where the PV system is connected in accordance with 705.12(A) and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible and clearly indicate whether the PV system is “off” or “on.” The initiation device shall be lockable in the “off” position.

4. PV system disconnecting means.

5. Readily accessible switch that plainly indicates whether the device is in the “off” or “on” position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation where conductors are not controlled, that remains energized upon loss of utility voltage from the utility.
Manually Reset.

When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

Equipment.

Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed and labeled and identified for providing rapid shutdown protection.

Marking.

1. The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

   RAPID SHUTDOWN PV SYSTEM DISCONNECT

2. If a rapid shutdown initiation device is not located near the service disconnecting means, a sign shall be installed at the service disconnecting means location, identifying the location of the initiation device. Exception: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.

   Rapid shutdown equipment not meeting the requirements of 690.12(B)(2) shall be labeled Rapid Shutdown Equipment for PV.

   Informational Note: Inverter input circuit conductors can remain energized for up to 15 minutes with inverters not listed for rapid shutdown.

Statement of Problem and Substantiation for Public Comment

Sunrun supports the proposed alternative code language offered by the Solar Energy Industries Association (SEIA), which takes a balanced and reasonable approach to accessing actual safety risks and developing a variety of technical solutions to improve fire fighter safety. Sunrun supports these proposed revisions to 690.12 that will allow for continued electrical protection within the array and reduce risk for fire fighters, while providing needed flexibility for a variety of technical solutions to develop. We support the Fire Service in their intent to further enhance fire safety requirements in the 2017 NEC, however we disagree with the specific proposed requirement to limit voltage to 80 volts within an array after rapid shutdown initiation. This will effectively requires module level power electronics at significant upfront cost as well as unknown long term costs associated with reliability. There are currently too few proven module level products to choose from in the market.

SEIA's proposal addresses fire service safety concerns without the negative effects of prescribing a specific product technology which has limited selection. Reliance on a specific technology would stifle innovation of potentially more effective rapid shutdown technologies, increase cost, and decrease the value of solar PV to the consumer.

Additionally, new technologies should only be incorporated into the NEC on an incremental basis, and should allow time to test new technologies in the field to ensure reliability and safety. To allow adequate time for the development of this standard, it is essential that the effective date of subsection 690.12(B)(2) be deferred until January 1, 2020. Deferment will also allow for additional field testing of rapid shutdown equipment before final adoption of the article.

Committee Statement

Committee: Rejected but see related SR
Action:
Resolution:
Statement: This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(2)(b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.

A section-by-section summary of the changes are described below.

Main paragraph:
Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment” for consistency of terminology.

Section (A):
This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):
This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array to be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):
The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):
This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new
clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
690.12  Rapid Shutdown of PV Systems on Buildings.

PV system circuits installed on or in buildings shall include a rapid shutdown in accordance with 690.12 (A) through (E).

(A) Controlled Conductors.

Requirements for controlled conductors shall apply to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2) Controlled. Rapid shutdown equipment shall be installed to limit firefighter exposure to electrical hazards from the controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. array boundary and shall be listed and labeled as PV Equipment Safe for Proximity Fire Fighting.. This requirement shall become effective January 1, 2020.

Informational Note 1: The designation PV Equipment Safe for Proximity Fire Fighting identifies equipment and components that limit firefighter exposure to an electrical hazard within the array boundary after the Rapid Shutdown initiator has been activated. This designation addresses single point failures that might occur when the PV system is inadvertently damaged by firefighting operations or other mechanical damage or during a building fire. Control of electric shock hazard may be achieved by methods such as limiting access to exposed components that might become energized, reducing the potential difference between energized components, limiting the electric current that might flow in an electrical circuit involving personnel with increased resistance of the conductive circuit, or by a combination of such methods.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

(C) Initiation Device.

Where multiple PV systems are installed on a single service, a single device shall initiate the rapid shutdown of all PV systems on that service. Additional auxiliary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted. The rapid shutdown initiation device shall comply with one of the following:

(1) Where the PV system is connected in accordance with 705.12(D) and rapid shutdown initiates upon loss of voltage from the utility, the service disconnecting means shall be the initiation device.

(2) Where the PV system is connected in accordance with 705.12(A) and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

(3) Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible and clearly indicate whether the PV system is “off” or “on.” The initiation device shall be lockable in the “off” position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation where conductors are not controlled upon loss of voltage from the utility.

(D) Manually Reset.

When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

(E) Equipment.

Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed, labeled, and identified for providing rapid shutdown protection. Rapid shutdown equipment not meeting the requirements of 690.12(B)(2) shall be labeled Rapid Shutdown Equipment for PV.

(F) Marking.

(1) The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

RAPID SHUTDOWN PV SYSTEM DISCONNECT

Committee Statement

Committee Action: Rejected but see related SR

Resolution: This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(2)(b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.

A section-by-section summary of the changes are described below.

Main paragraph:
Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment” for consistency of terminology.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, "PV Equipment Safe for Proximity Fire Fighting." Both the term "Rapid Shutdown PV Array" and "PV Equipment Safe for Proximity Fire Fighting" can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.
The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforced by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
**Public Comment No. 1850-NFPA 70-2015 [Section No. 690.12]**

**690.12 Rapid Shutdown of PV Systems on Buildings.**

PV system circuits installed on or in buildings shall include a rapid shutdown in accordance with 690.12 (A) through (E).

(A) Controlled Conductors.

Requirements for controlled conductors shall apply to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2) Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

(C) Initiation Device.

Where multiple PV systems are installed on a single service, a single device shall initiate the rapid shutdown of all PV systems on that service. Additional auxiliary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted. The rapid shutdown initiation device shall comply with one of the following:

(1) Where the PV system is connected in accordance with 705.12(D) and rapid shutdown initiates upon loss of voltage from the utility, the service disconnecting means shall be the initiation device.

(2) Where the PV system is connected in accordance with 705.12(A) and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

(3) Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible and clearly indicate whether the PV system is “off” or “on.” The initiation device shall be lockable in the “off” position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation where conductors are not controlled upon loss of voltage from the utility.

(D) Manually Reset.

When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

(E) Equipment.

Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed, labeled, and identified for providing rapid shutdown protection.

(F) Marking.

(1) The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

RAPID SHUTDOWN PV SYSTEM DISCONNECT

(2) If a rapid shutdown initiation device is not located near the service disconnecting means, a sign shall be installed at the service disconnecting means location, identifying the location of the initiation device.

Exception: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs the Panel to revise the text including the informational note to comply with the NEC Style manual.

Committee Statement

Committee Action: Rejected but see related SR
Resolution:
Statement: This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(2)(b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.

A section-by-section summary of the changes are described below.

Main paragraph:

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment” for consistency of terminology.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the...
area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce
by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the
same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The
standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It
further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first
paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family
dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for
fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new
clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If
not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know
that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would
reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The
informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece
of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been
captured in that new, much longer and detailed section.
### 690.12 Rapid Shutdown of PV Systems on Buildings.

PV system circuits installed on or in buildings shall include a rapid shutdown in accordance with 690.12 (A) through (E).

**(A) Controlled Conductors.**

Requirements for controlled conductors shall apply to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

**(B) Controlled Limits.**

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

1. Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

2. Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

**(C) Initiation Device.**

Where multiple PV systems are installed on a single service, a single device shall initiate the rapid shutdown of all PV systems on that service. Additional auxiliary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted. The rapid shutdown initiation device shall comply with one of the following:

1. Where the PV system is connected in accordance with 705.12(D) and rapid shutdown initiates upon loss of voltage from the utility, the service disconnecting means shall be the initiation device.

2. Where the PV system is connected in accordance with 705.12(A) and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

3. Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible and clearly indicate whether the PV system is “off” or “on.” The initiation device shall be lockable in the “off” position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation where conductors are not controlled upon loss of voltage from the utility.

**(D) Manually Reset.**

When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

**(E) Equipment.**

Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed, labeled, and identified for providing rapid shutdown protection.

**(F) Marking.**

1. The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

   **RAPID SHUTDOWN PV SYSTEM DISCONNECT**

2. If a rapid shutdown initiation device is not located near the service disconnecting means, a sign shall be installed at the service disconnecting means location, identifying the location of the initiation device.

*Exception: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.*

---

**Statement of Problem and Substantiation for Public Comment**

I support the effort to reduce the voltage in a PV array under emergency conditions.

Committee Statement

Committee Action: Rejected
Resolution: No changes were recommended by the submitter.
690.12 Rapid Shutdown of PV Systems on Buildings.

PV system circuits installed on or in buildings shall include a rapid shutdown in accordance with 690.12 (A) through (E).

(A) Controlled Conductors.

Requirements for controlled conductors shall apply to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

1. Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

2. Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

(C) Initiation Device.

Where multiple PV systems are installed on a single service, a single device shall initiate the rapid shutdown of all PV systems on that service. Additional auxiliary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted. The rapid shutdown initiation device shall comply with one of the following:

1. Where the PV system is connected in accordance with 705.12(D) and rapid shutdown initiates upon loss of voltage from the utility, the service disconnecting means shall be the initiation device.

2. Where the PV system is connected in accordance with 705.12(A) and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

3. Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible and clearly indicate whether the PV system is “off” or “on.” The initiation device shall be lockable in the “off” position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation where conductors are not controlled upon loss of voltage from the utility.

(D) Manually Reset.

When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

(E) Equipment.

Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed, labeled, and identified for providing rapid shutdown protection.

(F) Marking.

1. The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

RAPID SHUTDOWN PV SYSTEM DISCONNECT

2. If a rapid shutdown initiation device is not located near the service disconnecting means, a sign shall be installed at the service disconnecting means location, identifying the location of the initiation device.

Exception: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.

Statement of Problem and Substantiation for Public Comment

Enphase Energy supports the language proposed by CMP-4 especially the reduced voltage level within an array when initiated by emergency personnel. Rooftop PV arrays should reduce be able to shut down to safe voltage levels in the event of emergency conditions. This is particularly important when considering the life span of a system as older systems may present electrical hazards to emergency personnel.

690.12 Rapid Shutdown of PV Systems on Buildings.

PV system circuits installed on or in buildings shall include a rapid shutdown in accordance with 690.12 (A) through (E).

(A) Controlled Conductors.
Requirements for controlled conductors shall apply to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

(B) Controlled Limits.
The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

2) Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

(C) Initiation Device.
Where multiple PV systems are installed on a single service, a single device shall initiate the rapid shutdown of all PV systems on that service. Additional auxiliary initiation devices operating in accordance with rapid shutdown equipment listings shall be permitted. The rapid shutdown initiation device shall comply with one of the following:

1) Where the PV system is connected in accordance with 705.12(D) and rapid shutdown initiates upon loss of voltage from the utility, the service disconnecting means shall be the initiation device.

2) Where the PV system is connected in accordance with 705.12(A) and rapid shutdown initiates upon loss of voltage from the utility, the PV system disconnecting means shall be the initiation device.

3) Where rapid shutdown does not initiate upon loss of voltage from the utility, the initiation device shall be readily accessible and clearly indicate whether the PV system is “off” or “on.” The initiation device shall be lockable in the “off” position.

Informational Note: 690.12(C)(3) would apply to, for example, a PV system with standby operation where conductors are not controlled upon loss of voltage from the utility.

(D) Manually Reset.
When the rapid shutdown system is manually initiated the PV system shall not reset without manual intervention.

(E) Equipment.
Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed, labeled, and identified for providing rapid shutdown protection.

(F) Marking.

1) The rapid shutdown initiation device shall have a sign complying with 690.56 located on or no more than 1 meter (3 ft) from the device that includes the following wording:

RAPID SHUTDOWN PV SYSTEM DISCONNECT

2) If a rapid shutdown initiation device is not located near the service disconnecting means, a sign shall be installed at the service disconnecting means location, identifying the location of the initiation device.

Exception: Ground mounted PV system circuits that enter buildings or structures, of which the sole purpose is to house PV power generating equipment, are not required to comply with 690.12.

Statement of Problem and Substantiation for Public Comment

I am in favor of this first revision to reduce the voltage within an array during emergency operations.

Submittal Date: Mon Sep 21 17:05:35 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: No changes were recommended by the submitter.
Public Comment No. 1338-NFPA 70-2015 [Section No. 690.12(A)]

(A) Controlled Conductors.
Requirements for controlled conductors shall apply to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

Statement of Problem and Substantiation for Public Comment

The second sentence "PV inverter output circuits shall only be required to be controlled from the PV source" is unclear as to its intent. If intended for module integrated inverters, it is implying that a disconnect device is required on the dc side of the inverter (so that the ac inverter output is de-energized). I think it is meant to apply to roof-mounted string inverters that are more than 3 ft from the array.

Committee Statement

Committee Action: Rejected but see related SR
Resolution:
Statement: This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(2)(b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.

A section-by-section summary of the changes are described below.

Main paragraph:

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change "PV power generating equipment" to "PV system equipment" for consistency of terminology.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):
This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, "PV Equipment Safe for Proximity Fire Fighting." Both the term "Rapid Shutdown PV Array" and "PV Equipment Safe for Proximity Fire Fighting" can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforced by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the "off" position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an "on" or "off" position. The new clarified wording requires that an initiator in the "off" position requires that the PV system be in the rapid shutdown mode. If not initiators are turned "off" and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the "off" position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
Controlled Conductors.

Requirements for controlled conductors shall apply only to PV system dc circuits and inverter output circuits supplied by the PV system. PV system dc circuits shall be controlled from all sources of supply, including energy storage or other dc power sources, as applicable. PV inverter output circuits shall only be required to be controlled from the PV source.

Statement of Problem and Substantiation for Public Comment

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment” for consistency of terminology.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):
This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2).

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2) Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

Statement of Problem and Substantiation for Public Comment

80 V seems an arbitrary limit, not determined by the shock hazard. Household voltage exceeds 220 Vac; the electrocution hazard is considered acceptable for residents, etc. The hazardous voltage threshold for DC is higher than for AC and firefighters wear gloves that offer at least some additional protection.

Raising the voltage to 220-240 V, or similar, would bring the code more in line with existing standards.

The problem with this requirement from the firefighter's perspective is it creates a false sense of security. The module-level electronics required to achieve the 80-V limit are certain to fail over time, in ways that may not be predictable. Hidden behind the solar modules on a roof, they will be difficult to check. If the electronics doesn't "fail safe", firefighters that trust the rapid shutdown system may not take adequate precautions. In this case, it would be better, for example, to throw fire blankets over the array to assure low voltage within the array boundary. Dry leather gloves might also be better protection than electronics that may or may not be working as promised.

Committee Statement

Committee Action: Rejected
Resolution: No changes were recommended by the submitter.
Public Comment No. 1224-NFPA 70-2015 [Section No. 690.12(B)]

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to outside the array boundary shall comply with 690.12(B) (1) and inside the array boundary shall comply with 690.12(B) (2).

1. Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

2. Controlled Rapid shutdown equipment shall be installed to limit firefighter exposure to electrical hazards from the controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.\n
Informational Note: The designation PV Equipment Safe for Proximity Fire Fighting identifies equipment and components that limit firefighter exposure to an electrical hazard within the array boundary after the Rapid Shutdown initiator has been activated. This designation addresses single point failures that might occur when the PV system is inadvertently damaged by firefighting operations or other mechanical damage or during a building fire. Control of electric shock hazard may be achieved by methods such as limiting access to exposed components that might become energized, reducing the potential difference between energized components, limiting the electric current that might flow in an electrical circuit involving personnel with increased resistance of the conductive circuit, or by a combination of such methods.

This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

Statement of Problem and Substantiation for Public Comment

The proposed language of 690.12(B)(2), which effectively mandates the use of module-level electronics to comply, cannot be practically enforced and field verified by the authority having jurisdiction (AHJ). This is a concern for several reasons:

1. Volume - This places the burden of verifying the presence and effectiveness of over 10 million devices projected to be installed on buildings annually by the year 2018, squarely on the shoulders of local AHJs. (Source: Citi Research)

2. Liability - The associated liability from the failure of these electronics to perform as anticipated could fall with the AHJ. This liability concern is best avoided by the application of the provisions found in Article 90.7 of the NEC, Examination of Equipment for Safety, which places the task of verifying suitability of specific electrical components in the hands of a nationally recognized testing laboratory.

3. Physical location – Arrays installed on pitched roofs may be inaccessible to AHJs tasked with verifying compliance.

4. Verification - The lack of adequate test points in a typical photovoltaic array would make the 80V and 10 second limitations impossible to verify without the dis-assembly of a completed installation. The proper training, tools, and personal protective equipment needed for such field testing is not widely available to all AHJs.

Given these concerns, it is unlikely the provisions of the proposal will be adequately enforced.

Committee Statement
Committee Action: Rejected but see related SR
Resolution: 
Statement: This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(2)(b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.

A section-by-section summary of the changes are described below.

Main paragraph:

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment” for consistency of terminology.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.
Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
Public Comment No. 1342-NFPA 70-2015 [ Section No. 690.12(B) ]

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2) Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

Statement of Problem and Substantiation for Public Comment

A Risk Analysis related to the PV Rapid Shutdown Proposal, 690.12(B)(2).

690.12(B)(2) essentially mandates module-level electronics in every PV module for rooftop solar. While perhaps a well-intentioned proposal to improve safety for fire fighters, it in fact is likely to both increase the number of accidents on rooftops (especially amongst electrical workers), and also increase the likelihood of rooftop fires. This proposed requirement will put thousands of IBEW and independent electrical contractors at risk, every year.

The 2014 NEC required in 690.4(C) “The installation of equipment and all associated wiring and interconnections shall be performed only by qualified persons.” – this means, in most cases, electrical contractors.

The submitters did not provide technical justification for this new requirement. In fact, PV systems have been installed on roofs now for more than 35 years. In this time, I understand that there has not been a single reported incidence of electric shock to fire fighters. This view is supported by the attached white paper from SMA, the world’s largest PV inverter manufacturer.

This proposal was promoted by manufacturers such as Enphase and Solar-edge who claim that their reliability numbers make maintenance a non-issue, and stand to profit enormously from this requirement. Enphase, for example claims a Mean Time Between Failure (MTBF) of > 300 years. This is a theoretical number, and it does not take into account beginning and end of life effects. It is also about 10 x higher than the MTBF numbers quoted by string inverter manufacturers (i.e., 30 years) which operate typically in a far less demanding thermal regime. The literature (e.g., the paper by Fronius, attached, suggests that a 100 year MTBF is more likely. I use 200 years in the analysis below).

Estimate of residential roof fires where a PV array is present (2022):
- NFPA reported 368,000 residential structure fires in 2014
- Assume roughly half of these resulted in a need for firefighter roof access (200,000)
- There will be about 1 million PV systems on residential roofs by 2022. That’s 0.75% of the total US housing stock of 133 million.
- Estimate of residential roof fires with PV on the roof (2022): 1500 per year.

Estimating rooftop inverter or converter failures (2022):
- Estimated new PV systems installed 2017 – 2022: 500,000 (source – SEIA – similar to current installation rate)
- Average system size: 10 kW
- Module/inverter rating: 250 W
- Module-inverters per system: 40
- Total inverters installed over 5 years: 20 million
- Estimated MTBF: 200 years (0.5% failures per year)
- Annual failures: 100,000 – which need to be repaired

In summary, a well-intentioned effort to protect firefighters from 1500 fire instances per year could put 100,000 electricians working on roofs every year. This is clearly an unreasonable risk and burden to the electrical worker community.

Further, as inverter failures per year would continue to grow as more systems are installed, and as inverter components age, things would get worse in later years.
The additional fire risk related to installing 20 million power electronics devices on rooftops is hard to quantify – but it probably more than 1500 per year. In other words, a measure designed to protect fire fighters could subject them to maybe twice as many fires with PV on the roof than without module-level rapid shutdown.

690.12(B)(2) mandates an UNPRECEDENTED installation of electrical apparatus on residential rooftops without full analysis of its personnel and fire-safety impact.

It is important to point out that replacing a micro-inverter or junction box converter in the middle of a PV array may involve disassembly of a significant portion of the array – it’s a complicated process that exposes the installer to fall hazards, and often several hours of rooftop work to replace a $200 component.

Finally, the proposal related to 690.12(B)(2) has not been developed in accordance with NFPA and ANSI regulations. The NFPA's Guide For The Conduct of Participants in the NFPA Standards Development Process states:

… all participants in the NFPA Standards Development Process should adhere to the following general principles:

(b) To maintain a process that is open, honest, and fair to all participants
(c) To promote the development of codes and standards that are scientifically and technically sound, that promote creativity and innovation in the development of new methods and technologies, and that set reasonable standards intended to minimize the possibility and effects of fire and related hazards
(d) To promote the development of consensus through the broad and balanced participation of a variety of interests and through the full airing and discussion of all points of view

690.12(B)(2), as proposed, fails to meet (b), (c), or (d). Rather than “minimizing the possibility and effects of fire and related hazards”, it increases them.

The representative for the solar industry on CMP4 (SEIA) voted negative (as did I – a former SEIA alternate) on the first draft of 690.12 revisions. The present 690.12 working group has little representation from the PV industry in general (i.e. module manufacturers, inverter manufacturers and installers). It appears to be a partisan group.

I urge CMP4 to remove 690.12(B)(2) as proposed, and give this topic to a balanced working group who can develop a consensus, technically sound proposal on this topic for the 2020 NEC.

Resolution:
Statement: This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(2). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.

A section-by-section summary of the changes are described below.

Main paragraph:

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock
hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment” for consistency of terminology.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):
The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
Public Comment No. 1382-NFPA 70-2015 [Section No. 690.12(B)]

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2).

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2) DC or 15 volts ac within 30 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(3) This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

Statement of Problem and Substantiation for Public Comment

Including conductors under the PV array as controlled conductors will mandate PV Module level electronics. This will result in significantly increased maintenance activities and reduced system reliability. The increase in risk of injury to service personnel will be an unacceptable unintended consequence.

The national fire code already includes requirements for roof access areas for firefighters. These access areas allow firefighters to perform their job in a reasonable manner with no risk of electrical injury. It would be reasonable to reduce the 1 Foot requirement to zero feet. This would allow firefighters to quickly and easily determine those areas that contain controlled conductors.

It is clear that those within the PV industry who are supporting the Module Level requirement stand to benefit from implementation as written. If we took this same approach to transportation vehicles, we would require that all petroleum products in the vehicle become non-flammable in the event of an accident.

If implemented as currently written, this will be a train wreck.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)2(b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPV) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.
A section-by-section summary of the changes are described below.

Main paragraph:

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment’ for consistency of terminology.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforced by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):
The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 30 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2) Controlled conductors located inside the array boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement, the PV system shall comply with either (a) or (b):

(a) Building-integrated PV power sources listed as a complete assembly, having no grounded components, and having ungrounded PV power source circuits shall be listed and labeled or field labeled as a building-integrated rapid shutdown PV array.

(b) PV system DC circuit components shall be listed and labeled as rapid shutdown PV equipment.

The requirement of 690.12(B)(2) shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

Statement of Problem and Substantiation for Public Comment

Dow Chemical is a manufacturer of BIPV shingles that do not have accessible wiring. Field inspection to the 690.12(B)(2) requirement is impossible without damaging the product. Dow Chemical strongly supports the development of a test standard so that compliance can be verified through listing/labeling. It is Dow’s preference that compliance to a listing/labeling requirement be mandated in the code for all industry participants, but as a minimum it should be allowed as a method of compliance. Options (a) and (b) are added to address this.

Option (a) is for products expected to function as part of the building envelope long after the power production lifetime has expired. These products can remain installed for 50 years or more, far longer than the life of the electronics inside of them. When listed as a PV array rather than as a sum of listed components, manufacturers can eliminate shock hazards without the use of electronics. The Dow Chemical BIPV shingle achieves this objective by eliminating conduction paths, even when wet and damaged. It does not use a metal frame or racking system. The product listing restricts applications to pitched, wooden roof decks. There is no grounded metal on the roof, and when used in combination with an ungrounded inverter, there is no possible conduction path to ground even if the PV circuit is exposed. These types of inherent safety improvements for BIPV products should not be discouraged through prescriptive code language. BIPV products should instead be subject to a different listing requirement that enables an equivalent or greater level of shock hazard protection using methods that consider the longevity of the products.

Option (b) is for non-BIPV component manufacturers that want to comply through listing/labeling much like they do today for other code requirements.

30V (725.41) and 50V (200.7) are industry-standard voltage cutoffs already defined within the Code. The arbitrary 80V language in 690.12(B)(2) is uniquely tailored to allow microinverter companies a method of compliance without meeting a listing/labeling requirement. This favors a particular industry technology designed for traditional PV modules. No equivalent technology exists for many types of building integrated PV. Dow has reached out to over 30 electronics firms that serve the PV market. None of those firms have or will have technology by 2018 that would enable BIPV firms to comply with the 690.12(B)(2) requirement. Even with an option for compliance through listing/labeling, if a test standard is not finalized by January 2018, Dow and other BIPV manufacturers will be unable to meet the code requirement. If this happens, the listing exemption will give microinverters an unfair market advantage. There is no technical reason to treat microinverters differently in the code.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(2)(b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.

A section-by-section summary of the changes are described below.

Main paragraph:
Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change "PV power generating equipment" to "PV system equipment" for consistency of terminology.

Section (A):
This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):
This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, "PV Equipment Safe for Proximity Fire Fighting." Both the term "Rapid Shutdown PV Array" and "PV Equipment Safe for Proximity Fire Fighting" can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the...
area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the "off" position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an "on" or "off" position. The new clarified wording requires that an initiator in the "off" position requires that the PV system be in the rapid shutdown mode. If not initiators are turned "off" and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the "off" position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to "labeled" since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2) Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Exception: Building-integrated photovoltaics with no grounded components except as required by 690.31(G).

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

Statement of Problem and Substantiation for Public Comment

30V (725.41) and 50V (200.7) are industry-standard voltage cutoffs already defined within the Code. The 80V value is not derived from any safety testing; it is designed to allow compliance through the use of microinverters and traditional panels. No equivalent technology exists for many types of building integrated PV (BIPV). The 80V requirement therefore favors a particular industry technology, and non-traditional PV products should be allowed time to develop similar solutions. Industry experts, including those representing microinverter companies, have publically estimated this development cycle to be about 5 years. An exception for one code cycle is therefore warranted for what is a relatively small segment of the overall rooftop PV market.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.

Main paragraph:

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard for emergency responders is clearly stated.
hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment” for consistency of terminology.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):
The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
Statement of Problem and Substantiation for Public Comment

Worker safety exposure due to the PV Rapid Shutdown Proposal 690.12(B)(2)

690.12(B)(2), as proposed, is not the most effective path to increase firefighter safety, but increases risk and hazard exposure to electricians, thereby leading to an overall increase in risk for injury and fatality and an overall reduction in safety.

SEIA estimates that over 645,000 homes and businesses have installed solar power systems as of 2014. The only fatalities related to PV have involved falls from rooftops, falls through skylights or workers accidentally contacting overhead service lines while preparing scaffolding to work on roofs (http://www.cdph.ca.gov/programs/ohb-face/Pages/Solar.aspx). According to OSHA, in 2013 falls were the leading cause of worker deaths on construction sites, accounting for 36.5% of deaths in construction-related injuries and fatalities (https://www.osha.gov/oshsstats/commonstats.html). There are no recorded instances of firefighters being killed or injured due to hazards from PV systems.

All power electronics fail and will require service and troubleshooting. 690.12(B)(2) effectively mandates module-level power electronics at every module for rooftop solar. The greatest threat to worker safety is having to work on the roof, and every piece of power electronics placed on the roof is another exposure to worker risk. We must make sure that the risks we ask electrical workers to take on are balanced and fair, and present a reasonable risk in minimizing the possibility and effects of fire and related hazards.

Representatives of the fire service tell us that they need to quickly ventilate a structure that is on fire, and as a ten year veteran of the fire service and Chief of a rural fire department, I can tell you that they are right. However, the position that vertical ventilation is the best and only way to ventilate, and that the fire service therefore needs full and unlimited access to the roof, does not align with modern fire science. Some firefighters joke that the fire service has a hundred years of tradition unimpeded by progress, but there is new information available that many fire services are embracing as it offers a safer, more effective way of ventilation than rooftop operations.

The majority of homes and structures built today are dramatically different than those of our grandparents. Construction is lightweight trusses and engineered lumber, not beams and timbers. According to a study by UL comparing the effects of fire on modern versus legacy homes, today's larger homes, open layout, increased fuel loads and lightweight construction materials result in faster fire propagation, shorter time to flashover, shorter escape times and shorter time to structural collapse (UL, Analysis of Changing Residential Fire Dynamics and Its Implications on Firefighter Operational Timeframes, p3, http://newsScience.unl.com/wp-content/uploads/2014/04/Analysis_of_Changing_Residential_Fire_Dynamics_and_Its_Implications_on_Firefighter_Operational_Timeframes.pdf). Under these conditions, fast and effective ventilation becomes increasingly important. However, studies performed by NIST and others have shown that Positive Pressure Ventilation (PPV) is a more effective method than traditional vertical ventilation. In tests representative of a residential fire, PPV “lowered the temperatures in the room, forced all of the combustion products to flow out of the room without affecting the corridor and improved the visibility leading up to and in the room itself. In this experimental configuration a fire fighting team would likely have been able to attack the PPV ventilated fire more easily than the naturally ventilated fire” (NISTIR 7213, Effect of Positive Pressure Ventilation on a Room Fire p16, http://www.nist.gov/customcf/get_pdf.cfm?pub_id=861347).

In a similar test evaluating the effectiveness of PPV in large structures, “the pressure was increased sufficiently to: reduce temperatures, giving potential occupants a more survivable environment and increase fire fighter safety, limit smoke spread, keeping additional parts of the structure safe for occupants and undamaged and reducing the scale of the emergency for the fire fighters, and increase visibility, allowing occupants a better chance to self evacuate and providing fire fighters with an easier atmosphere to operate in. Positive pressure ventilation is a tool the fire service can utilize to make their job safer and more efficient” (NIST Technical Note 1498, Evaluating Positive Pressure Ventilation In Large Structures: School Pressure and Fire Experiments, p187, http://www.nist.gov/customcf/get_pdf.cfm?pub_id=861537).

According to this research, vertical rooftop ventilation can no longer be considered the golden standard for effective fireground operations. 690.12 should ensure that a local source of electricity (i.e. the PV array) can be easily disconnected from a building electrical system in
the event of a fire, and 690.12(B)(1) achieves that goal. Requiring conductors within the array zone to be controlled to 80 volts does not provide a touch-safe environment, and there are thousands of legacy PV installations currently installed which are not controlled within the array zone; therefore, 690.12(B)(2) creates a false sense of security for the fire service. Fire operations should not be in the array zone when there are better options.

The current proposal for 690.12(B)(1) ensures the control of conductors leaving the array field, and significantly limits the zone around a PV array where conductors are not controlled. This is a reasonable and workable level of safety, as it will allow a significant reduction in rooftop power electronics devices versus the module-level required by 690.12(B)(2). In addition, those components on the roof will be located at or under the edge of the array, leading to corresponding reductions in time-on-roof for service and maintenance versus having to pull every module, which directly relates to risk of fall hazard exposure to electrical workers.

The safety of PV systems has increased substantially in the past few code cycles, based on reasoned analysis of incidents in the field, lab tests, and a consensus process involving broad stakeholder participation. This led to the implementation of improvements such as arc fault protection and improvements in ground fault detection and protection. Recent studies indicate additional improvements can be made in terms of arc fault detection, and that process is underway. These improvements have significantly increased the safety of a PV system through the broad and balanced participation of a variety of interests promoting the development of codes and standards. That can not be said for 690.12(B)(2).

Mandating new requirements in the NEC for the power electronics required to achieve 80v module-level of control is premature, not scientifically or technically sound, and will only expose electrical workers to higher levels of risk, to the benefit of a few companies. I urge CMP4 to remove 690.12(B)(2).

First Revision No. 1008-NFPA 70-2015 [Section No. 690.12]
Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
Public Comment No. 1433-NFPA 70-2015 [Section No. 690.12(B)]

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2) Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

Statement of Problem and Substantiation for Public Comment

690.12(B.2) as written would in effect mandate the installation of electronics on every single PV module installed. Although this change may have been advanced in the interest of life safety, we believe it is unnecessary and will in fact have the opposite effect.

While PV modules themselves are extremely reliable (warranted to last 25 years in most cases), module electronics is a very new industry - the leading providers of this equipment were founded less than 10 years ago, and early models suffered from significant reliability issues. If module electronics are mandated by NEC and even a few widely-deployed makes or models of module electronics are found to be unreliable in the field, it will result in hundreds of thousands of otherwise un-necessary roof accesses, each one of which carries risk of accident to electrical personnel. Because of the nature of module electronics, in many cases a large number of modules may need to be removed to access the faulty module electronics component - this is awkward work that multiplies the level of risk.

It is also not at all clear that module-level electronics reduces the risk of fire, because by its nature it increases the number of electronic components on the roof by 1-2 orders of magnitude, and while the available commercial units are in theory designed for a 25 year life, virtually none of the models being deployed today have been in service for even 5 years.

Besides the significant safety issues, failures related to newly-mandated module-level rapid shutdown equipment could have a catastrophic effect on the solar industry. Even in the absence of widespread failures, module-level electronics significantly increases the cost and complexity of solar installations.

Module electronics also adds significant cost and complexity for a questionable (and quite possibly negative) safety benefit. Array- and subarray-level solutions are available that provide ample safety as demonstrated by millions of installations in the US and Europe. We propose that 690.12(B.2) be struck from the 2017 code, and module-level electronics technology be allowed to mature further, and an open, honest, fair, and scientifically sound process be employed before such an unprecedented mandate is imposed.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety
A section-by-section summary of the changes are described below.

Main paragraph:

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment” for consistency of terminology.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would...
reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
Controlled Limits.
The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

Controlled conductors located inside or not more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

Statement of Problem and Substantiation for Public Comment

Deleted information note on 690.12 B.2 shouldn't define any option for non listed rapid shutdown components/systems to activate rapid shutdown.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

Statement of Problem and Substantiation for Public Comment

It appears technical innovations to reduce I^2R losses could be inhibited by this rule. This rule could impede module efficiency improvements and hence slow cost reductions for clean energy.

Committee Action: Rejected but see related SR
Resolution: This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)2(b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.

A section-by-section summary of the changes are described below.

Main paragraph:

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment” for consistency of terminology.

Section (A):
This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it is more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2).

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2) Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

(3) Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

Statement of Problem and Substantiation for Public Comment

Bosch is concerned with the safety of everyone working with or around PV systems, and especially with the safety of those working on rooftops such as firefighters and personnel installing or maintaining the PV systems. Modern PV systems have achieved a level of elegant simplicity in terms of the amount of required rooftop equipment, resulting in very high reliability systems that may be installed on rooftops quickly and efficiently with little or no maintenance required over the lifetime, reducing the amount of time installers, electricians, and other service personnel need to spend on the rooftop. The rapid-shutdown requirements added in NEC 2014 also help to assure firefighters that any voltages generated by the PV array exist only near the array itself after a rapid shutdown is initiated, allowing the firefighters to work confidently on other areas of the rooftop or in other areas of the building nearby the PV array if needed during an emergency.

Bosch is very experienced in producing high reliability electronics for harsh environments through our automotive, industrial, and other activities. The 80V requirement essentially requires sophisticated electronics to be installed on the rooftop at or near every PV module, drastically increasing the complexity of the PV array, especially in large commercial rooftop installations which may contain thousands of PV modules. Even with the most reliable electronics, this increase in complexity will result in increased installation time and especially increased maintenance over the lifetime, resulting in more personnel working on rooftops with the associated risks involved.

Bosch believes the rapid shutdown requirement introduced with NEC 2014 already provides a high level of protection to firefighters, in the rare case they need to work nearby PV arrays on rooftops or in buildings due to an emergency situation. The added complexity of adding potentially thousands of disconnection circuits between the PV modules within a single PV array itself as proposed for NEC 2017 would add an unnecessary level of complexity, decreasing reliability and increasing the occurrence of rooftop maintenance work. Maintaining a potentially large number of electronic components distributed within a PV array as would be required by this 2017 NEC rapid shutdown proposal is also a much more complex and time-consuming task as compared to maintaining a much smaller amount of electronic components around the periphery of a PV array, as required by the NEC 2014 rapid shutdown requirement. Therefore, the time workers will need to spend on the rooftop is increased both by the quantity of additional electronics needed and by the relatively inaccessible location of the electronics within the array, especially for large commercial arrays. Although the proposal is well intentioned, Bosch does not believe the 80V requirement would result in a safer system overall when considering all potential for accidents to personnel working on the rooftop over the lifetime of the system.

Committee Statement

Committee Rejected but see related SR
A section-by-section summary of the changes are described below.

Main paragraph:

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment” for consistency of terminology.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):
This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
Public Comment No. 1696-NFPA 70-2015 [ Section No. 690.12(B) ]

(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to outside the array boundary shall comply with 690.12(B) (1) and inside the array boundary shall comply with (B)(2).

1. Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds, 30 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

2. Controlled rapid shutdown equipment shall be installed to limit firefighter exposure to electrical hazards from the controlled conductors located inside the array boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 90 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. array boundary and shall be listed and labeled as PV Equipment Safe for Proximity Fire Fighting.

Informational Note: The designation PV Equipment Safe for Proximity Fire Fighting identifies equipment and components that limit firefighter exposure to an electrical hazard within the array boundary after the Rapid Shutdown initiator has been activated. This designation addresses single point failures that might occur when the PV system is inadvertently damaged by firefighting operations or other mechanical damage or during a building fire. Control of electric shock hazard may be achieved by methods such as limiting access to exposed components that might become energized, reducing the potential difference between energized components, limiting the electric current that might flow in an electrical circuit involving personnel with increased resistance of the conductive circuit, or by a combination of such methods.

This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

(1) 2020

Statement of Problem and Substantiation for Public Comment

The proposed revisions to 690.12(B)(2) are intended to increase electrical safety to unqualified personnel, including firefighters, working on damaged equipment within the array boundary. While SolarCity supports the fire service in their intent to increase safety within the boundary of the array, the First Draft of Article 690.12(B)(2) has been written in such a way that effectively prescribes a specific type of electronic solution currently available in the marketplace. These devices are typically referred to as Module Level Power Electronics (MLPE) and include products like microinverters and optimizers. They are complicated devices, with a wide array of functions, but they were never designed for the sole purpose of “turning off” solar modules. The use of these complex devices as the means to accomplish rapid shutdown is a concern for several reasons.

HOW RELIABLE ARE MODULE LEVEL POWER ELECTRONICS (MLPE)?

• Prominent manufacturers of MLPEs often point to their “Mean-Time-Between-Failure” models (MTBF) to support their claims of reliability. According to Lusser’s Law, the chance that a system will fail is calculated by multiplying the Mean-Time-Between-Failures (MTBF) for each part by the number of parts. So if a MLPE has 500 parts in series, and each part is 99.9% reliable, the reliability of the entire MLPE device drops to 60%. Translation: the many features and functions of MLPEs = more failure points.
• Modeling the lifetime of these complex devices is hard. Models that translate to real-life field performance don’t exist yet. This was painfully exposed when an industry-leading maker of Module Level Power Electronics had to admit that their MTBF models, which had been advertised as sophisticated and reliable, had significantly underestimated true failure rates in the field. This manufacturer had to correct their financial statements about warranty claims on their failed devices to the tune of tens of millions of dollars. [1]
• Nonetheless, MLPE manufacturers claim that devices should last up to 25 years even though conventional inverters, with comparable parts and functions, are rated to last only 12-15 years. But their models do not realistically predict the reliability of the individual parts inside them. Even for the most trusted and experienced manufacturers, bad batches make it through to final production. MTBF calculations do not consider the impact of manufacturing quality issues.
• Dr. Jack Flicker of Sandia National Laboratories says the failures are caused, in part, by “more extreme diurnal temperature cycling [with] increased stress on componentry [resulting in] more difficult thermal management.” With “one MLPE unit for every module [equal to] 5,000 units per megaWatt of PV [it is] difficult-to-impossible to track and repair/replace units as they fail.” [2]
• Bottomline: These devices have not been built for the sole purpose of “turning off” solar modules. Because of their complexity, these devices cannot last as long as solar panels and even the best manufacturers, with established track records, have had to back track on their reliability claims. If the existing manufacturers are having a hard time, what will that mean when new companies rush to market with new rapid shutdown devices that are supposed to protect firefighters?
SAFETY FOR FIRST RESPONDERS & SOLAR WORKERS

- While the effort to enhance safety for first responders is laudable, it is important to remember that not a single firefighter has been killed while on a building with solar, suggesting that existing safety provisions for PV have been largely effective.
- While the solar industry aggressively promotes worker safety, falls remain the number one cause of death among all construction workers.[3] If MLPEs are mandated as rapid shutdown devices, solar construction workers will be the ones replacing them during the life of the system. Mandating one device beneath every solar module will directly increase the time solar construction workers will have to spend on the roof to replace them. More time on roof = higher risk of falling.
- The best way to mitigate this increased danger to American solar workers, is to place rapid shutdown devices in accessible locations that can be reached quickly and safely for testing and service, not beneath each solar module.
- There is another danger to using MLPEs to accomplish rapid shutdown. Even when these devices work “as advertised,” the system is never truly “shutdown.” A solar module producing 80V is not the same as “Off.” UL confirmed as recently as June, in their evaluation of firefighter PPE, that voltages *below* 80V still pose a risk. This was disclosed at the NFPA conference, which several members of this panel attended. A reduction in voltage does not eliminate the hazard, giving unsuspecting firefighters a false sense of security that only puts them at risk.
- Captain John Green, of the Los Angeles Fire Department (2nd largest in the US) echoed this when he said, “We don’t want our firefighters messing with the array, no matter what. Our protocol is a proven operating process, and adding layers of guess work complicates the job. Some systems might have panel level shutdown, some will not. Some of those that do will be operative, some will not. So we do not want that option to even exist; in a situation, there is no time to try to figure out what might work or not on a solar system. There is enough uncertainty in what we do. For us, the rule is ‘Do not engage’, period.”[4]
- Bottomline: Requiring the Module Level Power Electronics to accomplish rapid shutdown poses hazards to firefighters and solar construction workers alike. Even prominent members of the fire service do not support, and will not rely on, Module Level Power Electronics to protect them.

The First Draft of Article 690.12 effectively prescribes an immature technology, not expressly designed to accomplish rapid shutdown. It has the unintended effect of putting firefighters and solar workers in harm’s way. We urge this panel to vote against it and instead support the proposal put forth by SEIA’s representatives as the best path to develop safety solutions that achieve the intent of 690.12 without prescribing a single technology that closes the door on innovation.

Committee Statement

Rejected but see related SR

This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(2b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.

A section-by-section summary of the changes are described below.

Main paragraph:

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for.
For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change "PV power generating equipment" to "PV system equipment" for consistency of terminology.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
(B) Controlled Limits.

The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to 690.12(B) (1) and (2)

(1) Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 12.5 \( \times \) 30 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

(2) Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 12.5 \( \times \) 30 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

Statement of Problem and Substantiation for Public Comment

It's become clear through discussions while incorporating RSS into the UL Standard that provision for low voltage ride through that is being required of new smart inverter technology is at odds with the RSS requirements when the initiation is by loss of utility power. To reduce the possibility of interference between RSS and low voltage ride though it is recommended that the shed down time be extended to 30 seconds.

This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
Controlled Limits.
The use of the term, array boundary, in this section is defined as 30 cm (1 ft) from the array in all directions. Controlled conductors shall apply to \[690.12(B)\] (1) and (2).

1. Controlled conductors located outside the boundary or more than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 30 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.

2. Controlled conductors located inside the boundary or less than 1 m (3 ft) from the point of entry inside a building shall be limited to not more than 80 volts within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground. This requirement shall become effective January 1, 2018.

Informational Note: Inverter input circuit conductors can remain energized for up to 5 minutes with inverters not listed for rapid shutdown.

Statement of Problem and Substantiation for Public Comment

There are devices available today that can implement the RSS functionality so there is no need to delay the requirement farther out than the adoption date of the 2017 NEC. Considering that other provisions are put in the NEC that have no effective way to implement them at the time of code adoption it seems to be unusual that this particular provision would be delayed. Even if no means is available when the 2017 NEC is adopted 90.4 can be used to waive the requirement as it is done in many other cases.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: 
Statement: This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.

A section-by-section summary of the changes are described below.

Main paragraph:

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment” for consistency of terminology.
Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to "labeled" since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
Public Comment No. 1693-NFPA 70-2015 [Section No. 690.12(E)]

(E) Equipment.

Equipment that performs the rapid shutdown functions, other than initiation devices such as listed disconnect switches, circuit breakers, or control switches, shall be listed, labeled, and identified for providing rapid shutdown protection.

Statement of Problem and Substantiation for Public Comment

Listing and verification requirement shouldn't be defines as part of NEC guideline

Committee Statement

Committee Action: Rejected but see related SR
Resolution:
Statement: This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.

A section-by-section summary of the changes are described below.

Main paragraph:

Renumbrered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment’ for consistency of terminology.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the 2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.
The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list. The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to "labeled" since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
TITLE OF NEW CONTENT

Type your content here ...

"Both significant weather-related, and seismic events can leave a PV system in an electrically hazardous condition, affecting fire service response. I am in full support of the IAFF First Revision #1008 to shutdown a rooftop PV array to the lowest degree possible utilizing current available products."

Statement of Problem and Substantiation for Public Comment

Statement of Problem
This submission reflects the incremental code change to lower the available PV system voltage after the initiation of a Rapid Shutdown. Eliminating areas of hazardous voltage within the array after shutdown, has been identified by both the fire service and insurance industry as a key gap and concern. This was the original recommendation of the NFPA Fire Task Group from the 2014 cycle with the 690.12 proposal for module level control. The UL 1741 standards body is expected to have an updated standard addressing module level control devices in place prior to implementation of the 2017 code.

There is no requirement in the NEC that there be a way to deenergize the electrical circuits connected to PV modules mounted on buildings. These circuits remain energized anytime the modules are illuminated and up to the maximum system voltage which can be up to 1,000Vdc. This results in increased level of danger to first responders when the structure has been damaged. Historically this has been accepted since there was no practical way to isolate a PV module from the PV source circuit that would operate remotely and on all PV modules in an array simultaneously. Module level systems were not developed to the point where products were readily available on the market to provide this functionality. Today this is no longer true, many reliable products are available that can be either incorporated into a PV module or added to a PV module in the field to provide PV module isolation by remote control. The reliability concerns from 2014 are no longer relevant today, and market data estimates that up to 10 million units capable of module level isolation are now in service.

Under normal fault response conditions, the inverter is taken offline due to the first fault. A risk of re-ignition remains with string and central inverters due to the discontinuation of fault detection, interruption, and annunciation when inverters are offline due to a fault, or maintenance. Module level electronics provide for continued array monitoring in the event one fault occurs within the system due to the series nature of the devices monitoring each module.

There is no longer any reasonable justification to not address the additional hazard that having energized conductors represents in a structure mounted PV array. Reducing the voltage only in conductors outside the array, leaves very large areas of a structure with hazardous voltages, and should be considered "off limits" to firefighters. Additionally this leaves no options for first or second responders to safely deenergize in the event of an emergency.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: Statement:

This SR represents the revised text of 690.12 as developed by CMP4 in reviewing the 35 PCs received on this one section. Many of the PCs were in support of one of three main concepts, and the majority of the PCs were focused on 690.12(B)(2)(b). In an effort to formulate the final version for ballot, PC 1332 was produced by the NFPA Fire Fighter Safety and PV Systems (FFSPVS) Task Group and was used as the basis for SR. Changes from the First Draft language are reflected in this statement. Where specific PCs edited the language of PC 1332, those changes are specifically called out. All other changes were either part of the original PC or added by CMP4.

A section-by-section summary of the changes are described below.

Main paragraph:

Renumbered list since two of the sections were removed. Also, the prime reason for rapid shutdown is clearly stated in the main paragraph as relating to the reduced shock hazard for emergency responders. The benefit of this reduced shock hazard to other personnel is not the purpose of this requirement or the standards that will support this requirement. This is an important distinction since some may try to use this equipment for purposes other than what they were intended for. For instance, 690.12 is not intended to provide electrical isolation for electrical worker safety. That electrical isolation is covered by the disconnecting means requirements in Part III, Disconnecting Means, of Article 690.

The exception in the main paragraph was edited based on PC 502 to change “PV power generating equipment” to “PV system equipment’ for consistency of terminology.

Section (A):

This section was greatly simplified since the definition of a PV system has also been greatly simplified in the 2017 NEC cycle. The PV system can only control the ac output of PV inverters on the PV supply side of the circuit. If that circuit is connected to a utility-connected circuit breaker, only the PV end of the circuit can be deenergized since the circuit breaker is connected to a utility source that may need to be separately turned off. This also addresses several PCs requesting similar simplification and clarification.

Section (B):

This section saw the most significant debate as it is the key difference between the 2014 NEC and the first draft of the
2017 NEC. The heading was changed to further clarify which section refers to outside versus inside the array boundary. Each subsection was given a heading for even further clarification.

The subsection related to within the array boundary [690.12(B)(2)] now provides for two methods of compliance. The first method is a performance requirement that requires the PV array be evaluated as a rapid shutdown PV array. Currently, there is no standard for this option, but it is key that this option be made available so that the standards process will see the need to develop a standard to which this equipment will be evaluated. It is expected that, once a standard is developed, many PV arrays will be listed and labeled for this function. However, some configurations may require field labeling which is why this option is also provided. PC 1408, the PC produced by the Solar Energy Industries Association (SEIA) recommended slightly different terminology, “PV Equipment Safe for Proximity Fire Fighting.” Both the term “Rapid Shutdown PV Array” and “PV Equipment Safe for Proximity Fire Fighting” can mean the same thing since the standard is yet to be written.

The fire service has expressed concern that the lack of a rapid shutdown PV array standard may result in lesser safety than the 80 volts required in 690.12(B)(2)(b). To further clarify that the intent of this listing process is for fire fighter safety, the informational note clarifies the intent that a listed product will equivalent or lesser hazard than a system built in accordance with 690.12(B)(2)(b). This clearly signals to the relevant standards committees, what the code intent is for this new standard. Option (c) is included to address PV arrays that present reduced shock hazard, other than 80 V arrays.

The informational note about capacitors in inverters was moved to the equipment section where it more relevant. Lastly, the wording of the start date of the requirements inside the array boundary were clarified to specifically only apply to the area inside the array boundary. All other requirements in 690.12 are intended to be enforced when this version is enforce by a jurisdiction.

Section (C):

The initiation device section was reorganized, simplified, and clarified for better enforcement. The list of devices is the same, but all the additional language about initiation on loss of utility voltage is removed since it is not relevant. The standard, which is already under development, addresses these different scenarios. The NEC only needs a simple list.

The main paragraph has been added to clarify that the function of the initiation device is to initiate rapid shutdown. It further clarifies that an initiation device in the “off” position puts the PV system in the rapid shutdown mode. Lastly, the first paragraph requires that the rapid shutdown initiator be located on the outside of the building for one- and two-family dwellings. This was requested by the fire service as many service disconnects may be internal to a building and difficult for fire fighters to access.

Section (D):

This section was removed since the three initiator options are all switches that have an “on” or “off” position. The new clarified wording requires that an initiator in the “off” position requires that the PV system be in the rapid shutdown mode. If not initiators are turned “off” and the rapid shutdown system initiates on a loss of utility voltage, the fire fighter must know that they are unprotected until the initiator is moved to the “off” position since the power could be restored, which would reenergize the PV system (and potentially other ac wiring in the building).

Section (E):

The word identified was changed to “labeled” since that is consistent with numerous changes in the first draft. The informational note was moved to this section as it is more relevant to equipment since inverters are one prominent piece of equipment.

Section (F):

The marking section has been completely moved to the marking section of 690.56(C) and the intent of 690.12(F) has been captured in that new, much longer and detailed section.
690.13 Photovoltaic System Disconnecting Means.

Means shall be provided to disconnect the PV system from all wiring systems including power systems, energy storage systems, and utilization equipment and its associated premises wiring.

(A) Location.

The PV system disconnecting means shall be installed at a readily accessible location.

Informational Note: PV systems installed in accordance with 690.12 address the concerns related to live conductors entering a building.

(B) Marking.

Each PV system disconnecting means shall be permanently marked to identify it as a PV system disconnect and shall indicate whether in the open or closed position. For PV system disconnecting means where the line and load terminals may be energized in the open position, the device shall be marked with the following words or equivalent:

WARNING

ELECTRIC SHOCK HAZARD

TERMINALS ON THE LINE AND LOAD SIDES MAY BE ENERGIZED IN THE OPEN POSITION

The warning sign(s) or label(s) shall comply with 110.21(B).

(C) Suitable for Use.

If the PV system is connected to the supply side of the service disconnecting means as permitted in 230.82(6), the PV system disconnecting means shall be listed as suitable for use as service equipment.

(D) Maximum Number of Disconnects.

Each PV system disconnecting means shall consist of not more than six switches or six sets of circuit breakers, or a combination of not more than six switches and sets of circuit breakers, mounted in a single enclosure, or in a group of separate enclosures. A single PV system disconnecting means shall be permitted for the combined ac output of one or more inverters or ac modules in an interactive system.

Informational Note: This requirement does not limit the number of PV systems connected to a service as permitted in 230.82(6), the PV system disconnecting means shall be listed as suitable for use as service equipment.

(E) Interrupting Rating.

The PV system disconnecting means shall have an interrupting rating sufficient for the maximum available short circuit current and voltage that is available at the terminals of the PV system disconnect.

(F) Type of Disconnect.

The PV system disconnecting means shall simultaneously disconnect the PV system conductors of the circuit from all conductors of other wiring systems. The PV system disconnecting means shall be an externally operable general-use switch or circuit breaker, or other approved means. A dc PV system disconnecting means shall be marked for use in PV systems or be suitable for backfeed operation.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that further consideration be given to the comments expressed in voting on FR 1014.

Committee Action: Accepted
Resolution: SR-946-NFPA 70-2015
Statement: The panel makes the editorial change as requested by the correlating committee and this PC.
(B) Marking.

Each PV system disconnecting means shall be permanently marked to identify it as a PV system disconnect and shall indicate whether in the open or closed position. The marking should indicate that it is a PV system disconnect or equivalent, but may provide additional information as warranted by the system configuration. The marking minimum shall be:

PV SYSTEM DISCONNECT

For PV system disconnecting means where the line and load terminals may be energized in the open position, the device shall be marked with the following words or equivalent:

WARNING
ELECTRIC SHOCK HAZARD
TERMINALS ON THE LINE AND LOAD SIDES MAY BE ENERGIZED IN THE OPEN POSITION

The warning sign(s) or label(s) shall comply with 110.21(B).

Statement of Problem and Substantiation for Public Comment

According to the current language, "Eacy PV System disconnecting means shall be permanently marked to identify it as a PV System disconnect" Some guidance should be provided in 690.13 for the marking. A suggestion is simply "PV System Disconnect" but it should be permitted to provide additional information depending on the system topology.

State: 
Zip: 
Submittal Date: Mon Sep 14 18:40:00 EDT 2015

Committee Statement
Committee Action: Rejected but see related SR
Resolution: SR-948-NFPA 70-2015
Statement: The panel changes the title of this section to “Ratings” rather than “Interrupting Rating” since disconnecting means do not
include interrupting ratings unless they have overcurrent protection as well. This will help reduce the confusion created
by original title. The short circuit current rating of an unfused disconnect is a function of the upstream overcurrent device
as covered in the listing of the disconnect.
(E) Interrupting Rating.

The PV system disconnecting means shall comply with one of the following interrupt rating requirements.

1. A PV system disconnecting means that uses a circuit breaker shall have an interrupting rating sufficient for the maximum available short circuit current and voltage that is available at the terminals of the PV system disconnect.

2. A PV system disconnecting means that does NOT provide overcurrent protection shall have an interrupting rating sufficient for the maximum operating current and voltage that is available at the terminals of the PV system disconnect. The disconnecting means shall have the bracing required to conduct the maximum available short circuit current.

Statement of Problem and Substantiation for Public Comment

SunPower would like to thank CMP 4 for making these much needed revisions to 690.13. Unfortunately, the interrupt rating requirement for the PV System Disconnect (PSD) was revised in such a way that a listed switch that does not provide overcurrent protection could not be used as a PSD. Switches without overcurrent protection would not be designed to be opened under fault conditions, only under normal operating loads. Thus, their design and their listing would only allow them to conduct the short circuit current during a fault condition, but not interrupt the fault. The overcurrent protection device would be designed to provide the fault interruption capability. It would be undesirable to prevent the use of standard switches as the PSD when upstream devices provide the required overcurrent protection.

In some system designs, a circuit breaker would be used for the PSD and it would provide both the disconnecting means and the overcurrent protection required to protect the circuit. For these systems, the interrupting rating of the PSD should include the maximum available short circuit current from the service/utility. These disconnects would need to comply with the requirement in 690.13(E)(1) that we have proposed here.

In other system designs, a separate fuse or circuit breaker would provide the overcurrent protection for the circuit. In this case, the PSD would not be used to interrupt the fault, only to disconnect the equipment under normal operating conditions. Thus, the interrupt rating of these switches would only need to deal with the maximum operating current available at the terminals of the switch. The switch does need to be capable of having fault current pass through it though should the fault be on the PV system side of the PSD, hence the bracing requirement. The PSD used for these system designs would need to comply with the requirement in 690.13(E)(2) that we have proposed here.

Submittal Date: Fri Sep 25 16:31:00 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-948-NFPA 70-2015
Statement: The panel changes the title of this section to “Ratings” rather than “Interrupting Rating” since disconnecting means do not include interrupting ratings unless they have overcurrent protection as well. This will help reduce the confusion created by original title. The short circuit current rating of an unfused disconnect is a function of the upstream overcurrent device as covered in the listing of the disconnect.
(F) Type of Disconnect.

The PV system disconnecting means shall simultaneously disconnect the PV system conductors of the circuit from all conductors of other wiring systems. The PV system disconnecting means shall be an externally operable general-use switch or circuit breaker, or other approved means. A dc PV system disconnecting means shall be marked for use in PV systems or be suitable for backfeed operation.

Informational Note: Dc-rated enclosed switches, open-type switches, and low-voltage power circuit breakers are suitable for backfeed operation.

Statement of Problem and Substantiation for Public Comment

The first draft mistakenly omitted the informational note that was in the FR.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-949-NFPA 70-2015
Statement: The first draft mistakenly omitted the informational note that was in the FR. A sentence was added to the informational note to identify which devices are not suitable for backfeed operation.
Isolating devices shall be provided to isolate PV modules, ac PV modules, fuses, dc-to-dc converters inverters, and charge controllers from all conductors that are not solidly grounded. An equipment disconnecting means or a PV system disconnecting means shall be permitted in place of an isolating device. Where the maximum circuit current is greater than 30 amperes for the output circuit of a dc combiner or the input circuit of a charge controller or inverter, an equipment disconnecting means shall be provided for isolation. Where a charge controller or inverter has multiple input circuits, a single equipment disconnecting means shall be permitted to isolate the equipment from the input circuits.

Informational Note: The purpose of these isolating devices are for the safe and convenient replacement or service of specific PV system equipment without exposure to energized conductors.

Statement of Problem and Substantiation for Public Comment

Problem: The proposed 30 Amperes limit is arbitrarily chosen. Typically available state of the art PV connectors are listed for a rated current of up to 35 Amperes (see UL file QIJQ2.E343590 - Amphenol, QIJQ2.E339277 - Huber+Suhner). Today's typical system designs rely on the availability of these connectors as isolating device (according to (C )1) up to this maximum limit.

Solution: We suggest to set the limit to 35 Amperes because there is a large number of listed standard PV connectors with a rated current of up to 35 Amperes. From a safety point of view there is no difference between a listed connector being used as isolating device in a circuit with a maximum current of 30 Amperes compared to a circuit with a maximum current of 35 Amperes. In either case the connector will be considered an isolating device according to (C )1 not to be disconnected under load and labeled accordingly.

Organization: SMA America
Street Address:
City:
State:
Zip:
Submittal Date: Thu Sep 24 17:26:34 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: The 30-amp limit was not chosen based upon the current-carrying capability of any device. The current was chosen based on the likelihood of injury if personnel were to ignore warnings not to disconnect under load. Choosing 35 amps simply opens the door for other manufacturers with 50 amp connectors to argue that the value should be 50 amps.
Isolating devices shall be provided to isolate PV modules, ac PV modules, fuses, dc-to-dc converters inverters, and charge controllers from all conductors that are not solidly grounded. An equipment disconnecting means or a PV system disconnecting means shall be permitted in place of an isolating device. Where the maximum circuit current is greater than 30 amperes for the output circuit of a dc combiner or the input circuit of a charge controller or inverter, an equipment disconnecting means shall be provided for isolation. Where a charge controller or inverter has multiple input circuits, a single equipment disconnecting means shall be permitted to isolate the equipment from the input circuits.

Informational Note: The purpose of these isolating devices are for the safe and convenient replacement or service of specific PV system equipment without exposure to energized conductors.

Committee Statement

Committee Action: Rejected
Resolution: The reference to 690.13(B) will not clarify, but it will confuse the distinction between 690.13 and 690.15.
**Public Comment No. 1727-NFPA 70-2015 [Section No. 690.15(B)]**

*(B) Interrupting Rating.*

An equipment disconnecting means shall have an interrupting rating sufficient for the maximum voltage and dc short-circuit or ac load current and voltage that is available at the terminals of the equipment. An isolating device shall not be required to have an interrupting rating.

**Statement of Problem and Substantiation for Public Comment**

The dc PV circuits are current limited and therefore define the disrupting current. For ac circuits, such as inverter output circuits, the conductors and disconnect switch are protected by an ODCP that carries proper interrupt current ratings for the fault current of the source. It is not necessary for the disconnect device to interrupt the full fault current, only the load current.

Submittal Date: Fri Sep 25 18:48:46 EDT 2015

**Committee Statement**

Committee Action: Rejected  
Resolution: The PC does not add clarity to this requirement. The basic requirement for the equipment disconnect is to open whatever current is flowing.
Public Comment No. 1225-NFPA 70-2015 [Section No. 690.15(C)]

(C) Isolating Device.
An isolating device shall not be required to simultaneously disconnect all current carrying conductors of a circuit. The isolating device shall be one of the following:

(1) A connector meeting the requirements of 690.33, and listed and identified for use with specific equipment.
(2) A finger safe fuse holder
(3) An isolating switch that requires a tool to open
(4) An isolating device listed for the intended application

An isolating device shall be marked “Do Not Disconnect Under Load” or “Not for Current Interrupting”.

Statement of Problem and Substantiation for Public Comment

This statement implies that connectors should be listed for use with the equipment that they are intended to isolate. This would be true if connectors are listed as part of the equipment being used under the “within the equipment” clause. However, if the isolating device is “within sight and within 10 feet of” they would not need to be listed to work specifically with that equipment - they would just be listed connectors. It is a general requirement that listed equipment be used in accordance with its listing, so this statement is unnecessary and misleading as written.

Submittal Date: Thu Sep 24 14:09:44 EDT 2015

Committee Statement

Committee Action: Rejected
Resolution: Most connectors on the market today do not carry a listing unless provided as part of a listed assembly. This clause was added in the 2014 NEC to clarify that connectors are not listed, but can be listed with equipment.
Public Comment No. 1728-NFPA 70-2015 [Section No. 690.15(C)]

(C) Isolating Device.

An isolating device shall not be required to simultaneously disconnect all current carrying conductors of a circuit. The isolating device shall be one of the following:

1. A connector meeting the requirements of 690.33 and listed and identified for use with specific equipment
2. A finger safe fuse holder
3. An isolating switch that requires a tool to open
4. An isolating device listed for the intended application

As: If an isolating device does not have an interrupting rating, it shall be marked “Do Not Disconnect Under Load” or “Not for Current Interrupting”.

Statement of Problem and Substantiation for Public Comment

690.15 states an Isolation device shall be permitted to have an interrupting rating. If so, then it is not necessary to mark it as “do not disconnect under load.”

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-950-NFPA 70-2015
Statement: The revision clarifies that only devices not rated to break the maximum circuit current under load are required to be marked.
Public Comment No. 1002-NFPA 70-2015 [Section No. 690.15(D)]

(D) Equipment Disconnecting Means.

An equipment disconnecting means shall simultaneously disconnect all current carrying conductors that are not solidly grounded of the circuit to which it is connected. An equipment disconnecting means shall be externally operable without exposing the operator to contact with live parts and shall indicate whether in the open or closed position. An equipment disconnecting means shall be one of the following devices:

1. A manually operable switch or circuit breaker
2. A connector meeting the requirements of 690.33(E) (1)
3. A load break fused pull out switch
4. A remote controlled circuit breaker, contactor, or relay that is operable locally and opens automatically when control power is interrupted

Informational Note: Devices marked with “line” and “load” are not suitable for backfeed or reverse current. Dc-rated enclosed switches, open-type switches, and low-voltage power circuit breakers are suitable for backfeed operation.

For equipment disconnecting means where the line and load terminals may be energized in the open position, the device shall be marked with the following words or equivalent:

WARNING
ELECTRIC SHOCK HAZARD
TERMINALS ON THE LINE AND LOAD SIDES MAY BE ENERGIZED IN THE OPEN POSITION

The warning sign(s) or label(s) shall comply with 110.21(B).

Exception: Connectors that meet 690.33 are shall be exempt from this marking requirement.

Statement of Problem and Substantiation for Public Comment

At the direction of the correlating committee, this comment changes "are" to "shall be".

Submittal Date: Tue Sep 22 23:31:40 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-952-NFPA 70-2015
Statement: The revision adds “lockable” to equipment disconnecting means to comply with 110.25.

"Live" was changed to "energized" for consistency.

The words "(off)" and "(on)" were added for consistency.

The reference to the warning in 690.13(B) makes repeating the warning unnecessary.

The informational note is removed and the content is captured in 690.13(F).
(D) Equipment Disconnecting Means.

An equipment disconnecting means shall simultaneously disconnect all current carrying conductors that are not solidly grounded of the circuit to which it is connected. An equipment disconnecting means shall be externally operable without exposing the operator to contact with live parts and shall indicate whether in the open or closed position. An equipment disconnecting means shall be one of the following devices:

1. A manually operable switch or circuit breaker
2. A connector meeting the requirements of 690.33(E) (1)
3. A load break fused pull out switch
4. A remote controlled circuit breaker, contactor, or relay that, or other Listed isolating means that is operable locally and opens automatically when control power is interrupted

Informational Note: Devices marked with “line” and “load” are not suitable for backfeed or reverse current. Dc-rated enclosed switches, open-type switches, and low-voltage power circuit breakers are suitable for backfeed operation.

For equipment disconnecting means where the line and load terminals may be energized in the open position, the device shall be marked with the following words or equivalent:

WARNING
ELECTRIC SHOCK HAZARD
TERMINALS ON THE LINE AND LOAD SIDES MAY BE ENERGIZED IN THE OPEN POSITION

The warning sign(s) or label(s) shall comply with 110.21(B).

Exception: Connectors that meet 690.33 are exempt from this marking requirement.

Statement of Problem and Substantiation for Public Comment

The requirements as written require either an isolating means or a disconnecting means, and allow a contactor or relay to act as a disconnecting means. It must be noted that contactors and relays may provide a disconnecting function, but generally do not provide adequate air gaps to be considered an isolating means. Additionally the contacts of contactors and relays are allowed to weld during short circuit testing, whereas Listed isolating devices are not allowed to weld. As the FR is presently written, there is an implication that relays and contactors can be used in place of an isolating means, which could result in a possible shock hazard. Since the purpose of allowing a remote disconnecting means is to provide the isolation needed to work safely on the equipment, the use of contactors or relays should not be allowed.

Suggest revising item (4) to read as follows: A remote controlled circuit breaker or other Listed isolating means, that is operable locally and opens automatically when control power is interrupted.

Submitter Information Verification

Submitter Full Name: MARVIN HAMON
Organization: HAMON ENGINEERING INC
Street Address: 
City: 
State: 
Zip: 
Submittal Date: Wed Sep 02 18:39:31 EDT 2015

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-953-NFPA 70-2015 See also SR 957, Section 690.31(E).
Statement: The panel removes the word “a” before “raceway.” The panel moves the general temperature correction factor table from 690.31(E) to 690.31(A) since it is relevant to all PV systems and not just flexible cords and cables. Moving this table makes it clearer as a new Table 690.31(E) is being added that directly relates to flexible cords and cables.
Identification.

PV system circuit conductors shall be identified at all accessible points of termination, connection, and splices. The means of identification shall be permitted by separate color coding, marking tape, tagging, or other approved means. Only solidly grounded PV system circuit conductors shall be marked in accordance with 200.6. PV system circuit conductors that are not solidly grounded shall not be marked white unless part of a multiconductor cable assembly.

Exception: Where the identification of the conductors is evident by spacing or arrangement, further identification shall not be required.

Statement of Problem and Substantiation for Public Comment

The sentence removed is redundant and not completely accurate. The revised and accepted text states that only solidly grounded conductors shall be marked as indicated in 200.6. Based on this not solidly grounded conductors can't be marked as white. The deleted sentence only references white as a marking for solidly grounded conductors, ignoring all the other types of marking called out in 200.6.

Organization: Brooks Engineering  
Street Address:  
City:  
State:  
Zip:  
Submittal Date: Tue Sep 22 23:36:12 EDT 2015

**Committee Statement**

Committee Action: Rejected but see related SR  
Resolution: SR-955-NFPA 70-2015  
Statement: This SR returns Type USE-2 as an allowable single conductor cable as the double-insulated nature of PV Wire is not required in functionally grounded or ungrounded systems as was previously thought. The functionally grounded and ungrounded PV systems, as shown in 690.41(A) are similar to Class I systems in Europe since they include equipment grounding conductors. The previous understanding that ungrounded PV systems needed to be similar to European Class II wiring systems has been found to be false.

The term “identified” replaces “labeled” since cables are identified with the marking on the cable. The cable reel will have the listing label, but this may not be available during an inspection whereas the marking is visible at 40” intervals for the AHU. The phrase, “within the PV array” was lost from the first revision language and reinstated in this SR. The rewording of the informational note was at the request of the correlating committee.
Public Comment No. 1163-NFPA 70-2015 [Section No. 690.31(C)]

(C) Single-Conductor Cable.

(1) General. Single-conductor cable listed and labeled as photovoltaic (PV) wire shall be permitted in exposed outdoor locations in PV source circuits. PV wire shall be installed in accordance with 338.10(B)(4) (b) and 334.30.

Exception: Single-conductor cable Type USE-2 shall be permitted in solidly grounded PV systems.

(2) Cable Tray. PV source circuits and PV output circuits using single-conductor cable listed and labeled as photovoltaic (PV) wire of all sizes, with or without a cable tray marking/rating, shall be permitted in cable trays installed in outdoor locations where the cable tray and/or conductors are not in contact with a building, provided that the cables are supported at intervals not to exceed 300 mm (12 in.) and secured at intervals not to exceed 1.4 m (4 1/2 ft). Where cable trays are in contact with a building, a cable tray marking/rating shall be required for single conductor PV wire contained in the cable tray.

Informational Note: Photovoltaic wire and PV cable have a nonstandard outer diameter. See Table 1 of Chapter 9 for conduit fill calculations. The warning sign(s) or label(s) shall comply with 110.21(B).

Statement of Problem and Substantiation for Public Comment

The committee statement in the Public Input phase expressed concern that the original proposed changes "... would remove the use of cable tray on buildings which was one of the intentions for the addition of 690.31(C)(2) in the 2014 Code. Cable tray must be installed in accordance with the manufacturer’s instructions, so unless there is a clearer way of distinguishing the concern of the submitter, the panel does not recommend the addition." The revised language submitted in this Comment addresses that concern by clearly allowing the use of cable tray in contact with a building when the PV wire inside the cable tray is listed for use in cable tray. The cable tray rating on single conductors means that they must pass a vertical-tray flame test that will ensure the conductors will not propagate flame. This is an important safety consideration for any conductors installed in cable tray where in or on a building to prevent the rapid transmission of flame along the wire.

Committee Statement

Committee Action: Rejected
Resolution: The testing requirements of PV Wire contain the fire rating requirements of concern by the submitter. Since this provision is limited to PV wire, the submitter’s concern is already covered in the existing language.
Additional Proposed Changes

Statement of Problem and Substantiation for Public Comment

The term identified was added as UL 4703 require PV wire to be marked with the words "Photovoltaic Wire", or "PV Wire" at intervals not exceeding 40 inches (1 meter).

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company's name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed);
other NRTL's have similar requirements.

Public Comment No. 1853-NFPA 70-2015 [Section No. 690.31(C)]

(C) Single-Conductor Cable.

(1) General. Single-conductor cable listed and labeled as photovoltaic (PV) wire shall be permitted in exposed outdoor locations in PV source circuits. PV wire shall be installed in accordance with 338.10(B)(4)(b) and 334.30.

Exception: Single-conductor cable Type USE-2 shall be permitted in solidly grounded PV systems.

(2) Cable Tray. PV source circuits and PV output circuits using single-conductor cable listed and labeled as photovoltaic (PV) wire of all sizes, with or without a cable tray marking/rating, shall be permitted in cable trays installed in outdoor locations, provided that the cables are supported at intervals not to exceed 300 mm (12 in.) and secured at intervals not to exceed 1.4 m (4 1/2 ft).

Informational Note: Photovoltaic wire and PV cable have a nonstandard outer diameter. See Table 1 of Chapter 9 for conduit fill calculations. The warning sign(s) or label(s) shall comply with 110.21(B).

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs the panel to consider rewrite the Informational Note so that it does not contain a requirement, to comply with 3.1.3 of the NEC Style Manual. The Correlating Committee also directs the panel to clarify the measurement at the end of (C)(2).

The phrase, “within the PV array” was lost from the first revision language and reinstated in this SR. The rewording of the informational note was at the request of the correlating committee.
Public Comment No. 478-NFPA 70-2015 [Section No. 690.31(C)]

(C) Single-Conductor Cable.

(1) General. Single-conductor cable listed and labeled as photovoltaic (PV) wire shall be permitted in exposed outdoor locations within the array locations for PV source circuits. PV wire shall be installed in accordance with 338.10(B)(4)(b) and 334.30.

Exception: Single-conductor cable Type USE-2 shall be permitted in solidly grounded PV systems.

(2) Cable Tray. PV source circuits and PV output circuits using single-conductor cable listed and labeled as photovoltaic (PV) wire of all sizes, with or without a cable tray marking/rating, shall be permitted in cable trays installed in outdoor locations, provided that the cables are supported at intervals not to exceed 300 mm (12 in.) and secured at intervals not to exceed 1.4 m (4 1/2 ft).

Informational Note: Photovoltaic wire and PV cable have a nonstandard outer diameter. See Table 1 of Chapter 9 for conduit fill calculations. The warning sign(s) or label(s) shall comply with 110.21(B).

Statement of Problem and Substantiation for Public Comment

My revision is to continue to limit exposed conductors within the array footprint per the 2014 NEC.

Statement of Problem and Substantiation for Public Comment

Not all PV wire is suitable for connection to moving parts since the number of strands can vary from PV wire to PV wire. The proposed table below matches the minimum number of strands required for other wires allowed in the NEC for connection to moving parts. The following revised text is intended to replace the FR998. PV wire may include aluminum conductors which are not suitable for flexing as work hardening of aluminum causes strand breakage. Additionally the reference to the derating table 690.31(E) and the Table 690.31(E) should be maintained.

Committee Action: Rejected but see related SR
Resolution: SR-953-NFPA 70-2015 See also SR 957, Section 690.31(E).
Statement: The panel removes the word "a" before "raceway." The panel moves the general temperature correction factor table from 690.31(E) to 690.31(A) since it is relevant to all PV systems and not just flexible cords and cables. Moving this table makes it clearer as a new Table 690.31(E) is being added that directly relates to flexible cords and cables.
Public Comment No. 1004-NFPA 70-2015 [Section No. 690.31(G)]

(G) Direct-Current Photovoltaic Source and System Direct-Current Output. Circuits on or Inside a Building.

Where dc PV source or system dc PV output circuits are run inside a building or structure, they shall be contained in metal raceways, Type MC metal-clad cable that complies with 250.118(10), or metal enclosures from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means. The disconnecting means shall comply with 690.13(B) and (C) and 690.15(A) and (B). The wiring methods shall comply with the additional installation requirements in 690.31(G)(1) through (4).

(1) Embedded in Building Surfaces.

Where circuits are embedded in built-up, laminate, or membrane roofing materials in roof areas not covered by PV modules and associated equipment, the location of circuits shall be clearly marked using a marking protocol that is approved as being suitable for continuous exposure to sunlight and weather.

(2) Flexible Wiring Methods.

Where flexible metal conduit (FMC) smaller than metric designator 21 (trade size \(\frac{3}{4}\) in.) or Type MC cable smaller than 25 mm (1 in.) in diameter containing PV power circuit conductors is installed across ceilings or floor joists, the raceway or cable shall be protected by substantial guard strips that are at least as high as the raceway or cable. Where run exposed, other than within 1.8 m (6 ft) of their connection to equipment, these wiring methods shall closely follow the building surface or be protected from physical damage by an approved means.

(3) Marking and Labeling Required.

The following wiring methods and enclosures that contain PV power source conductors shall be marked with the wording WARNING: PHOTOVOLTAIC POWER SOURCE by means of permanently affixed labels or other approved permanent marking:

(1) Exposed raceways, cable trays, and other wiring methods
(2) Covers or enclosures of pull boxes and junction boxes
(3) Conduit bodies in which any of the available conduit openings are unused
(4) Marking and Labeling Methods and Locations.

The labels or markings shall be visible after installation. The labels shall be reflective, and all letters shall be capitalized and shall be a minimum height of 9.5 mm (3/8 in.) in white on a red background. PV power circuit labels shall appear on every section of the wiring system that is separated by enclosures, walls, partitions, ceilings, or floors. Spacing between labels or markings, or between a label and a marking, shall not be more than 3 m (10 ft). Labels required by this section shall be suitable for the environment where they are installed.

Statement of Problem and Substantiation for Public Comment

The advent of the new definition for PV system dc circuit requires the editing of this section title and first sentence for clarity and consistency.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-959-NFPA 70-2015
Statement: This revision uses the newly defined term “PV system dc circuits” to simplify the language. The SR also removes the incorrect phrase “or structure” in two places since that term could be interpreted to require metal wiring methods in all PV systems, when this section is only intended to address PV systems in or on buildings.
(3) Marking and Labeling Required.
The following wiring methods and enclosures that contain PV power source System DC Circuit conductors shall be marked with the wording WARNING: PHOTOVOLTAIC POWER SOURCE by means of permanently affixed labels or other approved permanent marking:

(1) Exposed raceways, cable trays, and other wiring methods
(2) Covers or enclosures of pull boxes and junction boxes
(3) Conduit bodies in which any of the available conduit openings are unused

Statement of Problem and Substantiation for Public Comment

“PV power source” is an undifined term and should be replaced with Photovoltaic System DC Circuit which is defined.

Committee Statement

Committee Action: Rejected but see related SR  
Resolution: SR-962-NFPA 70-2015  
Statement: "PV power circuit" is replaced with "PV system dc circuit," which is a newly defined term.
**Public Comment No. 519-NFPA 70-2015 [Section No. 690.31(J)]**

| (J) Module Connection Arrangement. | For solidly grounded PV systems, the connection to a module or panel shall be arranged so that removal of a module or panel from a PV source circuit does not interrupt a grounded conductor connection to other PV source circuits. |

**Statement of Problem and Substantiation for Public Comment**

The PI this change is based on incorrectly concludes that this section would only apply to solidly grounded PV systems. Even in systems that are reference grounded removal of a PV module should not isolate the grounded conductor of any other PV module in the system from the reference ground.

Statement of Problem and Substantiation for Public Comment

Devices used to ground module frames as permitted in section 690.43(D) are tested in combination with specific PV modules, specific PV module frames, or specific mounting-system rails as identified in the individual certifications. When these devices are Certified (Listed) as a single-use bonding/grounding device, UL 2703 requires that the installation instructions shall include the statement "For single-use only" or the equivalent.

Therefore, if a module is displaced for access to a junction box, this would require the grounding device to be replaced, 110.3(B). Since these devices are specific to PV modules and mounting systems, it is highly unlikely that the person removing the module would have the correct replacement device to maintain the tested ground path of the Certified (Listed) system. Also, the way these devices are installed, typically a single device will ground multiple PV modules to the mounting-system. The removal of a single module will have a domino effect on other modules, thereby causing the replacement of numerous devices.

If these devices are not replaced, the grounding of the modules as required by 690.43(A) will be compromised and create a potentially hazardous installation. The following are typical notes found within the installation instructions for these types of devices;

Intended for SINGLE USE ONLY! Functionality will not be guaranteed if reused.

SINGLE USE ONLY! Do not torque fasteners down if position of solar modules is not finalized. Only slightly tighten fasteners to keep modules in place.

When replacing a single faulty module, also remove the adjacent module that connects to the same grounding device as the faulty module. This will ensure that there are never ungrounded modules in the array.

690.41 System Grounding.

(A) PV System Grounding Configurations.

One or more of the following system grounding configurations shall be employed:

Reference grounded 2-wire

(1) Ungrounded PV systems with one conductor referenced to ground

(2) Reference grounded bipolar PV systems with the reference (center tap) conductor referenced to ground and meets the requirements of 690.7(C)

(3) PV systems not isolated from the inverter output circuit

(4) Ungrounded PV systems

(5) a ground detector in accordance with 690.41(B)

(6) Solidly grounded PV systems as permitted in 690.41(B) Exception

(7) PV systems that use other methods that accomplish equivalent system protection in accordance with 250.4(A), with equipment listed and identified for the use.

Informational Note: The ground detector in ungrounded PV systems may include a ground-sensing circuit using a fuse, circuit breaker, resistance device, non-isolated grounded ac circuit, or electronic means that is part of a listed ground-fault protection system. Some conductors in these systems may normally be at ground potential but have voltage to ground during fault conditions.

(B) Ground Fault Protection Detector.

DC: DC PV arrays shall be provided with dc ground fault protection detector meeting the requirements of 690.41(B)(1) and (2) to reduce fire hazards.

Exception: Ground-mounted or pole-mounted PV arrays with not more than two paralleled source circuits and with all dc source and dc output circuits isolated from buildings shall be permitted without ground-fault protection. PV systems with no ground-fault protection shall be solidly grounded.

(1) Ground-Fault Detection and Interruption.

The ground fault protection device or system detector shall detect ground fault(s) in the PV array dc current–carrying conductors and components, including any intentionally grounded conductors, and be listed for providing PV ground-fault protection.

(2) Isolating Faulted Circuits.

The faulted circuits shall be isolated by one of the following two methods:

(1) The current-carrying conductors of the faulted circuit shall be automatically disconnected.

(2) The inverter or charge controller fed by the faulted circuit shall automatically cease to supply power to output circuits.

Additional Proposed Changes

Statement of Problem and Substantiation for Public Comment

The correlating committee had serious concerns about the terminology recommended in FR 991. This language was drafted to address the correlating committee concerns and to be more consistent with Article 250.21 provisions for ungrounded ac systems. The new definition for reference grounded PV systems was also removed to further address the correlating committee's concerns with the language and all references to reference grounded systems revised it 690.7 and 690.41.

First Revision No. 991-NFPA 70-2015 [Section No. 690.41]

Submitter Information Verification

Submitter Full Name: Bill Brooks
Organization: Brooks Engineering
Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-966-NFPA 70-2015
Statement: The revision changes “reference grounded PV system” to “functional grounded PV system” to be similar to the terminology used in the IEC and different from the reference ground terms in Article 517. The list in 690.41(A) is reworded for simplicity and understanding.

The SR adds the phrase “and isolate the PV system dc circuits from the ground reference in a functional grounded system” to the second option for isolating faulted circuits which addresses the need to interrupt the flow of fault current.
(A) PV System Grounding Configurations.

One or more of the following system grounding configurations shall be employed:

1. Reference grounded 2-wire PV systems with one conductor referenced to ground
2. Reference grounded bipolar PV systems with the reference (center tap) conductor referenced to ground and meets the requirements of 690.7(C)
3. Reference grounded PV systems not isolated from the and referenced to the, inverter output circuit ground
4. Ungrounded PV systems
5. Solidly grounded PV systems as permitted in 690.41(B) Exception
6. PV systems that use other methods that accomplish equivalent system protection in accordance with 250.4(A) with equipment listed and identified for the use

Statement of Problem and Substantiation for Public Comment

The full language from the PI for this change was not adopted leaving option (3) poorly defined. Revised wording better describes that non-isolated inverters can use the ground on the output side referenced to the input side to reference ground the dc circuits.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-966-NFPA 70-2015

Public Comment No. 1562-NFPA 70-2015 [Section No. 690.41(B)(1)]

(1) Ground-Fault Detection and Interruption.
The ground fault protection device or system shall
- detect
- be listed for providing PV ground-fault protection
- protection in the PV array dc current-carrying conductors and components, including any reference grounded conductors
- and be listed for providing PV ground-fault protection.
- Indication of the fault shall be provided.
- Automatically isolating from the ground reference for measurement purposes shall be permitted.

Statement of Problem and Substantiation for Public Comment

SunPower would like to thank the Panel 4 for making these very important changes to the ground fault protection (GFP) requirements for PV systems. There are a couple edits that were introduced in the new version that will produce some unintended consequences. Hence, SunPower requests that you make a few small revisions to the requirement in 690.41(B)(1). As it is written right now, it only requires that the GFP device detect the ground fault, not interrupt the fault. The interruption requirement previously existed in the 2014 version of 690.5. The indication requirement was also likely inadvertently lost in the new version of the language. Thus, SunPower requests that the panel revise the language to read “… shall be listed for providing PV ground-fault protection ...”. The requirement to provide "protection" will include both the need to detect the fault and interrupt it. We also included the requirement for providing an indication of the fault. As a coordinator of the UL Task Group revising the ground fault protection requirements in the US PV standards, it is critical that the STP be given clear direction on these requirements so that they can be included in the standard.

Another provision that was lost in the migration of the requirements from 690.5 was the allowance for automatically opening the ground reference for measurement purposes. The UL 62109-2 working group will require the use of insulation resistance measurement in grounded systems before the system starts to produce power. This measurement has the required sensitivity to detect low level ground faults that when left undetected have caused fires in PV systems. To implement this measurement, the system must temporarily disconnect from ground while it is performing the measurement. Prior to including the automatically opening provision in the 2014 version of 690.5, this approach was unnecessarily interpreted as a code violation. It is critical that the provision for opening the ground reference for automatic measurement purposes be retained to allow for implementation of this essential improvement in GFP.

Committee Statement
Committee Action: Rejected but see related SR
Resolution: SR-966-NFPA 70-2015
Statement: The revision changes “reference grounded PV system” to “functional grounded PV system” to be similar to the terminology used in the IEC and different from the reference ground terms in Article 517. The list in 690.41(A) is reworded for simplicity and understanding.

The SR adds the phrase “and isolate the PV system dc circuits from the ground reference in a functional grounded system” to the second option for isolating faulted circuits which addresses the need to interrupt the flow of fault current.
(2) Isolating Faulted Circuits.

The faulted circuits shall be isolated by one of the following two methods:

(a) The current-carrying conductors of the faulted circuit shall be automatically disconnected.

(b) The inverter or charge controller fed by the faulted circuit shall automatically cease to supply power to output circuits, and isolate the system from the ground reference if it is a reference grounded system.

Statement of Problem and Substantiation for Public Comment

For some reason, TerraView is highlighting all of 690.41(B)(2) as a revision. I am only proposing to add "and isolate the system from the ground reference if it is a reference grounded system" to the end of 690.41(B)(2)(b).

As I mentioned in my comment on 690.41(B)(1), SunPower is grateful to CMP 4 for making these very important changes to the ground fault protection (GFP) requirements for PV systems. The addition of the isolation requirement for grounded systems is critical for effective implementation of GFP in grounded systems. Turning off the inverter in these systems does not provide the isolation required to stop the fault current. The connection to ground must also be opened. The inclusion of the requested revision will address this gap.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-968-NFPA 70-2015
Statement: This revision is editorial.
(A) Buildings or Structures Supporting a PV System.

A building or structure supporting a PV system shall have a grounding electrode system installed in accordance with Part III of Article 250.

The PV system equipment grounding conductors shall be connected to the grounding electrode system of the building or structure supporting the PV system by means of the grounding electrode conductor, or the grounding bus of associated equipment connected to the grounding electrode conductor. This connection shall be in addition to any other equipment grounding conductor requirements in 690.43(C). The PV system equipment grounding conductors shall be sized in accordance with 690.45.

For solidly grounded PV systems, as permitted in 690.41(A)(5), the grounded conductor shall be connected to a grounding electrode system with a grounding electrode conductor sized in accordance with 250.166.

Informational Note: Previous versions of this Code treated all grounded PV systems as solidly grounded systems and therefore required that grounded PV systems have a dc grounding electrode conductor connected to the grounded PV system dc circuits. Since most PV systems installed in the past decade are not solidly grounded, this Code narrows the requirement for a dc grounding electrode conductor to only those that are actually solidly grounded in accordance with 690.41(A)(5). All other PV system grounding configurations listed in 690.41(A) do not require a dc grounding electrode conductor.

Statement of Problem and Substantiation for Public Comment

The language in the first draft caused some objections in the correlating committee. Much of the concern comes from wording in the informational note about grounded PV systems. With the rewriting of 690.41(A), it is more appropriate to explain that most PV systems are actually functional grounded systems with ground-fault detection systems. These systems must still have a connection to the grounding electrode conductor, but this connection typically occurs at the PV system disconnecting means on the output of the interactive inverter. That disconnecting means is often in service or distribution equipment that already has an established connection to the grounding electrode conductor. This provides the appropriate point to connect the equipment grounding conductor and ground-fault detector to ground.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-969-NFPA 70-2015
Statement: The language in the first draft caused concerns over wording in the informational note about grounded PV systems. These systems must still have a connection to the grounding electrode conductor, but this connection typically occurs at the associated equipment connected to the output of an interactive inverter or dc charge controller. That equipment already has an established connection to the grounding electrode conductor. This provides the appropriate point to connect the equipment grounding conductor and ground-fault detector to ground.
Public Comment No. 936-NFPA 70-2015 [ Section No. 690.47(A) ]

(A) Buildings or Structures Supporting a PV System.

A building or structure supporting a PV system shall have a grounding electrode system installed in accordance with Part III of Article 250.

The PV system equipment grounding conductors shall be connected to the grounding electrode system of the building or structure supporting the PV system. The equipment grounding conductor, or the grounding bus of associated equipment connected to the grounding electrode conductor. This connection shall be in addition to any other equipment grounding conductor requirements in 690.43(C). The PV system equipment grounding conductors shall be sized in accordance with 690.45.

For solidly grounded PV systems, as permitted in 690.41(A)(5), the grounded conductor shall be connected to a grounding electrode system with a grounding electrode conductor sized in accordance with 250.166.

Informational Note: Previous versions of this Code treated all grounded PV systems as solidly grounded systems and therefore required a dc grounding electrode conductor to be connected to grounded PV system dc circuits. Since most PV systems installed in the past decade are not solidly grounded, this Code narrows the requirement for a dc grounding electrode to only those that are actually solidly grounded in accordance with 690.41(A)(5). All other PV system grounding configurations listed in 690.41(A) do not require a dc grounding electrode conductor.

Statement of Problem and Substantiation for Public Comment

The changes proposed clarify that the array equipment (module frames, racking, etc.) can be connected to the grounding system through an equipment ground. The current wording seems to imply the equipment is connected through a GEC, when only an EGC is required.

Public Comment No. 1179-NFPA 70-2015 [Section No. 690.47(B)]

(B) Additional Auxiliary Electrodes for Array Grounding.

Grounding electrodes

A grounding electrode shall be permitted to be installed in accordance with 250.52 and 250.54, at the location of all ground- and pole-mounted PV arrays and as close as practicable to the location of roof-mounted PV arrays. The electrodes shall be permitted to be connected directly to the array frame(s) or structure. The dc grounding electrode conductor shall be sized according to 250.66. Additional electrodes are not permitted to be used as a substitute for equipment bonding or equipment grounding conductor requirements. The structure of a ground- or pole-mounted PV array shall be permitted to be considered a grounding electrode if it meets the requirements of 250.52. Roof-mounted PV arrays shall be permitted to use the metal frame of a building or structure if the requirements of 250.52(A)(2) are met.

Exception No. 1: An array grounding electrode(s) shall not be required where the load served by the array is integral with the array.

Exception No. 2: An additional array grounding electrode(s) shall not be required if located within 1.8 m (6 ft) of the premises wiring electrode.

Statement of Problem and Substantiation for Public Comment

This change would restore the language that is currently located in the 2014 NEC. This change was made with no technical substantiation being made one PI stated that the existing requirement was confusing, one PI attempted to relate this requirement to NFPA 780, this requirement is not intended to supersede or contradict the requirements that are used when installing a lightning protection system as covered in NFPA 780 but rather to provide some level of protection when a 780 system is not installed.

Committee Statement

Committee Action: Rejected
Resolution: The language of 690.47(B) is permissive rather than required since the provision is related to lightning protection which the statement in PC#1179 acknowledges. Since lightning protection is not a requirement in this Code, any provisions related to lightning protection should be permissive rather than required.
690.53 Direct-Current Photovoltaic Power Source.

A permanent label for the PV power source indicating the information specified in (1) through (3) shall be provided by the installer at dc PV system disconnecting means and at each dc equipment disconnecting means required by 690.15. Where a disconnecting means has more than one dc PV power source, the values in 690.53(1) through (3) shall be specified for each source.

(1) Maximum voltage
   Informational Note to (1): See 690.7 for voltage.

(2) Maximum circuit current
   Informational Note to (2): See 690.8(A) for calculation of maximum circuit current.

(3) Maximum rated output current of the charge controller or dc-to-dc converter (if installed)

Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that FR 996 be revised to comply with the NEC Style Manual, Section 2.1.5, Subdividing Sections.

Identification of Power Sources.

(A) Facilities with Stand-Alone Systems.
Any structure or building with a PV power system that is not connected to a utility service source and is a stand-alone system shall have a permanent plaque or directory installed on the exterior of the building or structure at a readily visible location. The plaque or directory shall indicate the location of system disconnecting means and that the structure contains a stand-alone electrical power system. —

(B) Facilities with Utility Services and Photovoltaic Systems.
Plaques or directories shall be installed in accordance with 705.10.

(C) Facilities with Rapid Shutdown.
Buildings or structures with both utility service and a PV system complying with 690.12 shall have a permanent plaque or directory that includes the following wording:

PHOTOVOLTAIC SYSTEM EQUIPPED WITH RAPID SHUTDOWN ARRAY PARTITIONING

The plaque or directory shall be reflective, with all letters capitalized and having a minimum height of 9.5 mm (3/8 in.), in white on red background. The plaque or directory shall be located on, or no more than 1 m (3 ft) from, the service disconnecting means to which the PV systems are connected, or in accordance with 690.56(A) or (B), as applicable, and shall indicate the location of the rapid shutdown initiator if not at the same location.

Statement of Problem and Substantiation for Public Comment

The First Revision for this article was totally inadequate to provide signage that insures first responder safety. The concern for the new language is that it does not provide methods to distinguish between legacy systems with no rapid shutdown, systems installed according to the 2014 NEC with array level disconnects, and systems that may installed according to a revised NEC. I chose the word partitioning since nothing in the array is shutdown.

Submittal Date: Tue Sep 15 16:41:32 EDT 2015

Committee Statement
Committee Action: Rejected but see related SR
Resolution: These new marking requirements for Rapid Shutdown PV systems were initially developed by the NFPA Fire Fighter Safety and PV Systems Task Group that was reorganized in December of 2014. This collaborative Task Group is working on proposals for NFPA 1, NFPA 70, and other related documents. This Task Group is made up of over 20 participants from Code Making Panel 4, the solar industry, the fire service, the insurance industry, test laboratories, and other relevant stakeholders.

The Rapid Shutdown marking requirements proposed in this second revision input includes the language for these signs and greyscale figures of the color signs to print in the Code. Actual examples of these signs will exist in the handbook of the 2017 NEC Handbook for section 690.56(C) and the Annex of NFPA 1, 2018 edition. The signs are provided here so that reviewers can visualize what the signs are intended to look like.

Two different signs are required on buildings depending on what type of rapid shutdown system is on the building. Systems with multiple rapid shutdown types will be required to have a detailed directory since a simple sign will not be sufficient to clarify the levels of hazard on the roof.
Lastly, all switches that are intended to be used as rapid shutdown switches shall be labeled with the words, “RAPID SHUTDOWN SWITCH FOR SOLAR PV SYSTEM.”
Statement of Problem and Substantiation for Public Comment

The Correlating Committee directs that further consideration be given to the comments expressed in voting on FR 989. The Correlating Committee directs the panel to clarify “rapid shutdown initiator” and correlate with FR 1008 for use of terms.

(C) **Facilities: Buildings**, with Rapid Shutdown.
Buildings

or structures with both utility service and a PV system complying with 690.12 shall have a permanent plaque or directory that includes the following wording:

PHOTOVOLTAIC SYSTEM EQUIPPED WITH RAPID SHUTDOWN

The plaque or directory shall be reflective, with all letters capitalized and having with PV systems, shall have a permanent labels as described in (1) through (3)

(1) Rapid Shutdown Type. The type of PV system rapid shutdown shall be labeled as described in a) or b):

a) For PV systems that shutdown the array and conductors leaving the array:

   SOLAR PV SYSTEM IS EQUIPPED WITH RAPID SHUTDOWN.
   TURN RAPID SHUTDOWN SWITCH TO THE "OFF" POSITION
   TO SHUTDOWN PV SYSTEM AND REDUCE SHOCK HAZARD IN ARRAY

The first two lines of the label shall be capitalized characters with a minimum height of 9.5 mm (3/8 in.) in white on green background and the remaining characters shall be capitalized with a minimum height of 4.8 mm (3/16 in.) in black on white background.

Figure 56(C)(1)(a)

b) For PV systems that only shutdown conductors leaving the array:

   EMERGENCY RESPONDER:
   SOLAR PV SYSTEM IS EQUIPPED WITH RAPID SHUTDOWN.
   TURN RAPID SHUTDOWN SWITCH TO THE "OFF" POSITION.

   TO SHUTDOWN CONDUCTORS OUTSIDE THE ARRAY. CONDUCTORS IN ARRAY REMAIN ENERGIZED IN SUNLIGHT.

The first two lines of the label shall be capitalized characters with a minimum height of 9.5 mm (3/8 in.) in white on red background, and the remaining characters shall be capitalized with a minimum height of 4.8 mm (3/16 in.) in black on white background.

Figure 56(C)(1)(b)
The labels in 690.56(C)(1)(a) and (b) shall include a simple diagram of a building with a roof. Diagram sections in red signify sections of the PV system that are not shutdown when the rapid shutdown switch is operated. Sections of the diagram in green signify sections of the PV system that are shutdown when the rapid shutdown switch is operated.

The rapid shutdown label in 690.56(C)(1) shall be located on or no more than 1 meter (3 ft) from the service disconnecting means to which the PV systems are connected, or in accordance with 690.56(A) or (B), as applicable, and shall indicate the location of the all identified rapid shutdown switches, if not at the same location.

(2) Buildings with More Than One Rapid Shutdown Type. For buildings that have PV systems with both rapid shutdown types or a PV system with a rapid shutdown type and a PV system with no rapid shutdown, a detailed plan view diagram of the roof shall be provided showing each different PV system and a dotted line around areas that remain energized after the rapid shutdown switch is operated.

(3) Rapid Shutdown Switch. A rapid shutdown switch shall have a label located on or no more than 1 meter (3 ft) from the switch that includes the following wording:

RAPID SHUTDOWN SWITCH FOR SOLAR PV SYSTEM

The label shall be reflective, with all letters capitalized and having a minimum height of 9.5 mm (3/8 in.), in white on red background.

(C) Facilities, Buildings, with Rapid Shutdown.

Buildings or structures, with both utility service and a PV system complying with 690.12 shall have a permanent plaque or directory that includes the following wording:

PHOTOVOLTAIC SYSTEM EQUIPPED WITH RAPID SHUTDOWN

located within 1 meter (3 ft) of the service disconnecting means to which the PV systems are connected. In one and two family dwellings where the service disconnecting means is located inside of the building, the plaque shall be located on the exterior of the building near the entrance of the main service conductors. In buildings other than one and two family dwellings that are equipped with a fire alarm system, an additional plaque shall be located within 1 meter (3 ft) of the main fire alarm panel or the primary access point to the building for the fire service. The plaque(s) shall include the following wording, symbols, and diagrams:

(1) The following symbol shall be placed in the upper left corner of the plaque:

See the attached image file for PV System Symbol.

(2) The following wording shall be to the right of the above symbol:

BUILDING EQUIPPED WITH SOLAR PANELS

(3) The following wording shall be printed below (C)(1) and (C)(2):

TURN THE RAPID SHUTDOWN SWITCH TO "OFF" POSITION TO SHUT DOWN THE SOLAR SYSTEM

(4) Where the rapid shutdown initiator is located more than 1 meter (3 ft) from the plaque, a directory shall be provided below (C)(3) that illustrates the location of the rapid shutdown initiator.

(5) A directory showing the PV equipment on the roof of the building shall be provided. All areas containing components or equipment that is not touch safe shall be highlighted in red on the directory.

(6) Below the rooftop directory, the warning symbol shall be printed followed by the wording:

WARNING - CONDUCTORS AND EQUIPMENT IN RED AREAS WILL REMAIN ENERGIZED

The plaque or directory shall be reflective, with all letters capitalized and having a minimum height of 9.5 mm (\( \frac{3}{8} \) in.) in white on red background. The plaque or directory shall be located on, or no more than 1 m (3 ft) from, the service disconnecting means to which the PV systems are connected, or in accordance with . The text from 690.56(C)(2) shall be printed in black on a white background. The text from 690.56(A)(C) or (B)(A), as applicable, and shall indicate the location of the rapid shutdown initiator if not at the same location shall be printed in white on red background.

Statement of Problem and Substantiation for Public Comment

A recent PV system safety survey, conducted by an independent consultant with a group of 10 firefighters (3 of whom had direct experience with fires in PV Systems on commercial buildings), revealed that more firefighters want clear instructions about what equipment is energized than any other safety improvement in PV systems. This result has motivated SunPower to resubmit its request that clear and simple signage requirements be added to the 2017 NEC for systems mounted on buildings. We are delighted that CMP 4 saw value in our original proposal and requested that the Firefighter Safety Task Group (FSTG) review our proposal. While the task group did consider our proposal and incorporated elements of our proposal in their recommendation, we believe there are some very dangerous concepts also included in their proposal that should NOT be adopted. As a result, we have updated our proposal and are resubmitting it for further consideration.

The intent of this proposal is to:

• Provide a clear and standard message to a firefighter that there is a PV system installed on the building because it may not be visible to them from the ground level.

• Avoid the use of technical terms like PV and Rapid Shutdown that would only be familiar to a firefighter trained on PV systems. We need to provide instructions that an untrained firefighter can use as well.

• Clearly communicate what is safe to touch and what is not safe to touch. Anything that is not touch safe should be labeled as energized.

The proposal from the FSTG had two major flaws. First, it still uses technical terms. Second, it requires highlighting equipment that lowers the voltage to 80V in green, which would communicate to a firefighter that there is no hazard associated with this equipment and that they could do anything to it without risk of injury. This is false and will lead to firefighters getting killed. At 80V, a wet person could be exposed to 160mA, which is double the 80mA need to electrocute a person. Thus, this green labeling is more dangerous to a firefighter than a system that does NOT have rapid shutdown because it could cause him/her to unknowingly electrocute...
himself/herself. Therefore, SunPower vehemently opposes the signage proposal from FSTG.

Instead, we recommend that CMP 4 adopt the requirements in this proposal which will require the use of a sign like the example attached to this proposal. This sign only uses terms that a non-expert on PV would use, it directs the firefighter to the location of the Rapid Shutdown Initiator (switch) if they are not next to it already, and it clearly identifies what equipment is still live after the system has been shut down. This will allow a firefighter to take the proper precautions when working with the PV system.

Committee Statement

Committee Action: Rejected but see related SR  
Resolution: These new marking requirements for Rapid Shutdown PV systems were initially developed by the NFPA Fire Fighter Safety and PV Systems Task Group that was reorganized in December of 2014. This collaborative Task Group is working on proposals for NFPA 1, NFPA 70, and other related documents. This Task Group is made up of over 20 participants from Code Making Panel 4, the solar industry, the fire service, the insurance industry, test laboratories, and other relevant stakeholders.

The Rapid Shutdown marking requirements proposed in this second revision input includes the language for these signs and greyscale figures of the color signs to print in the Code. Actual examples of these signs will exist in the handbook of the 2017 NEC Handbook for section 690.56(C) and the Annex of NFPA 1, 2018 edition. The signs are provided here so that reviewers can visualize what the signs are intended to look like.

Two different signs are required on buildings depending on what type of rapid shutdown system is on the building. Systems with multiple rapid shutdown types will be required to have a detailed directory since a simple sign will not be sufficient to clarify the levels of hazard on the roof.

Lastly, all switches that are intended to be used as rapid shutdown switches shall be labeled with the words, “RAPID SHUTDOWN SWITCH FOR SOLAR PV SYSTEM.”
Facilities with Rapid Shutdown.

Buildings or structures with both utility service and a PV system complying with 690.12 shall have a permanent plaque or directory that includes the following wording:

PHOTOVOLTAIC SYSTEM EQUIPPED WITH RAPID SHUTDOWN SHUTDOWN SYSTEM AS REQUIRED BY THE 2017 NEC

The plaque or directory shall be reflective, with all letters capitalized and having a minimum height of 9.5 mm (3/8 in.), in white on red background. The plaque or directory shall be located on, or no more than 1 m (3 ft) from, the service disconnecting means to which the PV systems are connected, or in accordance with 690.56(A) or (B), as applicable, and shall indicate the location of the rapid shutdown initiator if not at the same location.

Statement of Problem and Substantiation for Public Comment

The evolution of RSS system requirements between the 2014 and 2017 NEC require first responders to treat them differently or to assume all RSS systems only comply with the limited provisions of the 2014 NEC. Adding text to the marking indicating that the RSS system was designed to comply with the 2017 NEC will allow first responders to appropriately assess the operation of the system.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: Statement:

These new marking requirements for Rapid Shutdown PV systems were initially developed by the NFPA Fire Fighter Safety and PV Systems Task Group that was reorganized in December of 2014. This collaborative Task Group is working on proposals for NFPA 1, NFPA 70, and other related documents. This Task Group is made up of over 20 participants from Code Making Panel 4, the solar industry, the fire service, the insurance industry, test laboratories, and other relevant stakeholders.

The Rapid Shutdown marking requirements proposed in this second revision input includes the language for these signs and greyscale figures of the color signs to print in the Code. Actual examples of these signs will exist in the handbook of the 2017 NEC Handbook for section 690.56(C) and the Annex of NFPA 1, 2018 edition. The signs are provided here so that reviewers can visualize what the signs are intended to look like.

Two different signs are required on buildings depending on what type of rapid shutdown system is on the building. Systems with multiple rapid shutdown types will be required to have a detailed directory since a simple sign will not be sufficient to clarify the levels of hazard on the roof.

Lastly, all switches that are intended to be used as rapid shutdown switches shall be labeled with the words, "RAPID SHUTDOWN SWITCH FOR SOLAR PV SYSTEM."
Public Comment No. 997-NFPA 70-2015 [Section No. 690.56(C)]

(C) Facilities with Rapid Shutdown.
Buildings or structures with both utility service and a PV system complying with 690.12 shall have a permanent plaque or directory that includes the following wording:
PHOTOVOLTAIC SYSTEM EQUIPPED WITH RAPID SHUTDOWN
The plaque or directory shall be reflective, with all letters capitalized and having a minimum height of 9.5 mm (3/8 in.), in white on red background. The plaque or directory shall be located on, or no more than 1 m (3 ft) from, the service disconnecting means to which the PV systems are connected, or in accordance with 690.56(A) or (B), as applicable, and shall indicate the location of the rapid shutdown initiator if not at the same location.

Statement of Problem and Substantiation for Public Comment
Not all buildings have utility service, but every building that has a rapid shutdown PV system should be marked. We should not create an inadvertent loophole where the RSD function on stand-alone homes does not need to be marked.

Statement of Problem and Substantiation for Public Comment

UL recognizes the Correlating Committee created a global First Correlating Revision (FCR) which directed that in all locations where the term “and labeled” was added after “listed” during the First Revision Stage, the words “and labeled” after “listed” be deleted, returning to previous text. UL understands that the Correlating Committee appointed a task group to address several issues involving the use of the terms “listed” and “labeled,” most importantly, to clarify and establish a distinction between the terms “listed” and “labeled” which are often used interchangeably. UL supports the need for this task group. However, UL does not expect the work of this task group to affect the 2017 NEC regarding the issue of “listed and labeled.” As such, UL is submitting comments to request that the words “and labeled” be added in various locations throughout the Code for the reasons expressed in the public inputs UL submitted on this issue. UL believes that these revisions will address an ongoing problem that should not wait until the 2020 NEC for resolution.

Subsequent to the Public Input Code Panel Meetings, UL has discussed this issue with its Electrical Council whose membership includes many AHJs. The proposed revisions to the NEC received general support from the membership. This issue was also discussed at a NEMA – NRTLs Forum held on August 14, 2015 at NEMA Headquarters. UL reiterated its support for the proposed revisions. The NRTLs represented at the meeting voiced no objection to the proposals.

The rationale for the revision was simple, to provide information to the AHJ regarding the suitability of equipment they encounter. The mark on the product is the manufacturer’s attestation that the product is in compliance with the appropriate standard. NRTL’s conduct factory surveillance of products, surveillance is one method to validate the manufacturer’s attestation. Should a product be found not to be compliant the manufacturer has the option of removing the mark and shipping the product without the mark, or holding the shipment and bringing the product into compliance. In either case the “Listing” is not impacted, as the “listing” is created at the completion of the “original” certification of the product and indicates the authorization but not the mandate to label products. So the only true way an AHJ can determine whether the product he is seeing is compliant with the applicable standard is via a label on the product. Taking it one step further, listings change with time. It is quite possible that a “listing” has been withdrawn; however labeled product may still be available for sale. Should equipment that is labeled, but not listed, be deemed acceptable? Based on the NEC definitions, it is possible to have a product that meets the Article 100 definition of listed but the testing organization made the manufacture remove the label for a non-compliance issue.

As for the concerns of products that are too small to be labeled, the definition of labeled is not limited to an actual label, it also includes symbols, or other identifying marks. The Safety Standards which define the listing requirements do not address labeling of products as defined by Article 100. As a general rule, NRTL’s do not consider a product as being listed unless it is also labeled. The UL White Book states that “Only those products bearing the appropriate UL Mark and the company’s name, trade name, trademark or other authorized identification should be considered as being covered by UL’s Certification, Listing, Classification and Follow-Up Service. The UL Mark provides evidence of listing or labeling, which may be required by installation codes or standards.” Again the requirements for the UL Mark are not a Safety Standard requirement, they are a UL requirement and the only way to show that a product is UL Certified (Listed); other NRTL’s have similar requirements.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-972-NFPA 70-2015
Statement: The revision removes the content of Part VII and replaces it with a reference to Article 705 where all these requirements are duplicated with the exception of 690.57, Load Disconnect, which is antiquated language no longer relevant to PV systems particularly with the rewriting of Article 690 to specifically exclude the discussion of loads that are covered elsewhere in this Code. The SR removes the duplicated language with Article 705.
A normally interactive solar PV system shall be permitted to operate as a stand-alone system to supply loads that have been disconnected from electrical production and distribution network sources.

Statement of Problem and Substantiation for Public Comment

Preserve the last sentence of 690.61 from 2014 NEC which gives valuable information on stand alone systems. There are systems on the market having stand alone functionality without a battery which supply the load only with PV power. These systems are not covered by the requirements for battery systems addressed in a new chapter 7 article. Therefore, the last sentence of 690.61 is needed for clarification on the requirements for these type of systems.

The SR removes the duplicated language with Article 705.
690.61 Loss of Interactive System Power.

An inverter or an ac module in an interactive, normally interactive solar PV system shall automatically de-energize its output to the connected electrical production and distribution network upon loss of voltage in that system and shall remain in that state until the be permitted to operate as a stand-alone system to supply loads that have been disconnected from electrical production and distribution network, voltage has been restored, sources.

Statement of Problem and Substantiation for Public Comment

The wrong portion of the 2014 language was deleted. Inverters will be increasingly required to provide grid supporting functions even when the grid (EPS) falters, and this functionality is better described in the listing certification instead of an installation standard. Conversely, the clarification that an inverter may be permitted to continue operation in stand-alone mode after disconnecting from the grid upon loss of interactive systems power is still useful and serves a valid purpose.

Resolution: The panel decides to keep Part VIII for now and replace the content with a reference to Article 706 so that those who look to this section are properly directed to the appropriate Article.
690.72  Charge Control

(A)  General

Equipment shall be provided to control the charging process of the battery. Charge control shall not be required where the design of the photovoltaic source circuit is matched to the voltage rating and charge current requirements of the interconnected battery cells and the maximum charging current multiplied by 1 hour is less than 3 percent of the rated battery capacity expressed in ampere-hours or as recommended by the battery manufacturer.

All adjusting means for control of the charging process shall be accessible only to qualified persons.

Informational Note: Certain battery types such as valve-regulated lead acid or nickel cadmium can experience thermal failure when overcharged.

(B)  Diversion Charge Controller

(1)  Sole Means of Regulating Charging

A photovoltaic power system employing a diversion charge controller as the sole means of regulating the charging of a battery shall be equipped with a second independent means to prevent overcharging of the battery.

(2)  Circuits with Direct-Current Diversion Charge Controller and Diversion Load

Circuits containing a dc diversion charge controller and a dc diversion load shall comply with the following:

(1)  The current rating of the diversion load shall be less than or equal to the current rating of the diversion load charge controller. The voltage rating of the diversion load shall be greater than the maximum battery voltage. The power rating of the diversion load shall be at least 150 percent of the power rating of the photovoltaic array.

(2)  The conductor ampacity and the rating of the overcurrent device for this circuit shall be at least 150 percent of the maximum current rating of the diversion charge controller.

(C)  Buck/Boost Direct-Current Converters

When buck/boost charge controllers and other dc power converters that increase or decrease the output current or output voltage with respect to the input current or input voltage are installed, the requirements shall comply with 690.72(C)(1) and (C)(2).

(1)  The ampacity of the conductors in output circuits shall be based on the maximum rated continuous output current of the charge controller or converter for the selected output voltage range.

(2)  The voltage rating of the output circuits shall be based on the maximum voltage output of the charge controller or converter for the selected output voltage range.

Statement of Problem and Substantiation for Public Comment

The first draft erroneously kept this section that was deleted by the related FR.

Public Comment No. 1146-NFPA 70-2015 [ Sections 690.72(B), 690.72(C) ]

Sections 690.72(B), 690.72(C)

(B) · Diversion Charge Controller.

(1) · Sole Means of Regulating Charging.
A photovoltaic power system employing a diversion charge controller as the sole means of regulating the charging of a battery shall be equipped with a second independent means to prevent overcharging of the battery.

(2) · Circuits with Direct-Current Diversion Charge Controller and Diversion Load.
Circuits containing a dc diversion charge controller and a dc diversion load shall comply with the following:

(1) · The current rating of the diversion load shall be less than or equal to the current rating of the diversion load charge controller. The voltage rating of the diversion load shall be greater than the maximum battery voltage. The power rating of the diversion load shall be at least 150 percent of the power rating of the photovoltaic array.

(2) · The conductor ampacity and the rating of the overcurrent device for this circuit shall be at least 150 percent of the maximum current rating of the diversion charge controller.

(3) · PV Systems Using Utility-Interactive Inverters.
Photovoltaic power systems using utility-interactive inverters to control battery state-of-charge by diverting excess power into the utility system shall comply with (1) and (2):

(1) · These systems shall not be required to comply with 690.72(B)(2). The charge regulation circuits used shall comply with the requirements of 690.8.

(2) · These systems shall have a second, independent means of controlling the battery charging process for use when the utility is not present or when the primary charge controller fails or is disabled.

(C) · Buck/Boost Direct-Current Converters.
When buck/boost charge controllers and other dc power converters that increase or decrease the output current or output voltage with respect to the input current or input voltage are installed, the requirements shall comply with 690.72(C)(1) and (C)(2).

(1) · The ampacity of the conductors in output circuits shall be based on the maximum rated continuous output current of the charge controller or converter for the selected output voltage range.

(2) · The voltage rating of the output circuits shall be based on the maximum voltage output of the charge controller or converter for the selected output voltage range.

Statement of Problem and Substantiation for Public Comment

This comment is coordinated with the proposed new Article 706 Energy Storage Systems (FR 3662). Currently batteries are addressed in numerous places in the NEC such as Articles 480 and 690, which has been appropriate over time with the former article historically covering lead-acid batteries and the latter recently added to address the application of batteries in general, not just lead acid, to PV systems. The current state of energy storage technology, which includes batteries, and anticipated evolution of energy storage supports the need for a singular set of requirements in the NEC covering such systems. If this is not accomplished in the 2017 NEC and available to serve as a singular foundation for needed changes in the future, the provisions covering such systems will continue to reside in different places within the NEC and likely evolve to attach themselves as parts to existing criteria throughout the NEC. To foster the safe application of energy storage systems and facilitate the application and use of the NEC by technology proponents as well as those who install and inspect such systems there should be a singular article in the NEC on energy storage systems. This specific clause is replaced by 706.33.

Statement of Problem and Substantiation for Public Comment

Part VIII was supposed to be deleted according to the resolution logs. This section was erroneously retained. All energy storage language from Article 690 has been utilized in the new Article 706 - Energy Storage Systems. This deletion also includes all of 690.71, 690.72, and 690.74. Note there is an inconsistency in the on line TerraView FR and the NFPA published FR.

Statement: This language should have been removed in the first draft.
Flexible Cables.

Flexible cables, as identified in Article 400, in sizes 2/0 AWG and larger shall be permitted within the battery enclosure from battery terminals to a nearby junction box where they shall be connected to an approved wiring method. Flexible battery cables shall also be permitted between batteries and cells within the battery enclosure. Such cables shall be listed for hard-service use and identified as moisture resistant.

Flexible, fine-stranded cables shall be terminated only with terminals, lugs, devices, or connectors in accordance with 110.14.

Statement of Problem and Substantiation for Public Comment

The Correlating Committee advises that article titles and scope statements are the responsibility of the Correlating Committee. The Correlating Committee accepts the article scope. The Correlating Committee directs that further consideration be given to the comments expressed in voting on FR 7511 with regard to the Article title and text

Article 691. Large-Scale Photovoltaic (PV) Electric Supply Stations, Power Production Facility

691.1 Scope. This article covers the installation of large-scale PV electric supply stations, power production facilities operated for the sole purpose of providing electric supply to the utility transmission or distribution system with a generating capacity of no less than 5,000 kW. Electric supply stations, power production facilities, are locations containing the generating stations, solar photovoltaic power production facility, and substations, including their associated generator, storage battery, transformer, and switchgear areas. Facilities covered by this article have specific design and safety features unique to large-scale PV facilities.

Informational Note: 90.2(B)(5) includes information about utility-owned properties not covered under this Code. For additional information on electric supply stations, power production facilities, see ANSI/IEEE C2-2012, National Electrical Safety Code.

691.2 Definitions.

Engineering Supervision. Designed and approved (or certified) by a licensed professional engineer competent in the specific area under supervision.

Field Labeled (as applied to evaluated products). Equipment or materials to which has been attached a label, symbol, or other identifying mark of a field evaluation body (FEB) indicating the equipment or materials were evaluated and found to comply with requirements as described in an accompanying field evaluation report. [790, 2012]

Generating Capacity. The sum of the parallel inverter rated maximum continuous output power at 40°C in kilowatts (kW).

Generating Station, Solar Photovoltaic Power Production Facility. A plant wherein electric energy is produced by conversion from some other form of energy (e.g., chemical, nuclear, solar, wind, mechanical, or hydraulic) by means of suitable apparatus.

Utility Distribution System. An electrical system operated by a regulated utility company operating at an ac voltage greater than 1000 volts and less than 100,000 volts.

Utility Transmission System. An electrical system operated by a regulated utility company operating at a voltage equal to or greater than 100,000 volts.

691.4 Special Requirements for Large-Scale PV Electric Supply Stations, Power Production Facilities.

Large-scale PV electric supply stations, power production facilities, shall comply with the following:

1. Electrical circuits and equipment for large-scale PV electric supply stations, power production facilities, are accessible only to qualified personnel needed for the maintenance and operation of the PV electric supply station power production facility. Informational Note: Refer to NFPA 70E-2015, Standard for Electrical Safety in the Workplace, for electrical safety requirements.

2. Access to PV electric supply stations is power production facilities is restricted by fencing or other adequate means in accordance with 110.31. Field applied hazard markings shall be applied in accordance with 110.21(B).

3. The connection between the PV electric supply station power production facility and the utility transmission or distribution system is through medium- or high-voltage switch gear, substation, switch yard, or similar methods whose sole purpose is to safely and effectively interconnect the two systems.

4. The electrical loads within the supply station power production facility are only used to power auxiliary equipment for the generation of the PV power.

5. PV electric supply stations, power production facilities, shall not be installed on buildings.

691.5 Equipment Approval. All equipment used for interconnection with an electric utility shall be approved by the electric utility, and all electrical equipment shall be approved for installation by one of the following:

1. Listing and labeling

2. Field labeling

3. Where products complying with 691.5(1) or (2) are not available, by engineering review validating that the electrical equipment is tested to relevant standards or industry practice
691.6 Design Under Engineering Supervision.

Documentation of the engineered design of the electric supply station power production facility shall be provided upon request of the AHJ. An additional independent engineering report detailing compliance of the design with applicable standards and industry practice shall be provided upon request of the AHJ. This documentation shall include details of conformance of the design with Article 690, and any alternative methods to Article 690, or other articles of this Code.

691.7 Installation Under Engineering Supervision.

Documentation of the electric supply station power production facility installation shall be provided upon request of the AHJ. An additional independent engineering report detailing compliance with applicable standards and industry practice shall be provided upon request of the AHJ. This documentation shall include details of conformance of the installation with this Code, applicable standards, and industry practice. This documentation, where requested, shall be available prior to the commercial operation of the station facility.

691.8 Direct Current Operating Voltage.

For large-scale PV electric supply stations power production facilities operating at a dc voltage above 1000 volts, calculations shall be performed under engineering supervision.

691.9 Disconnection of Photovoltaic Equipment.

Isolating devices shall be permitted to be more than 1.8 m (6 ft) from the equipment where written safety procedures and conditions of maintenance and supervision ensure that only qualified persons service the equipment.

Informational Note: For information on lockout/tagout procedures, see NFPA 70E-2015, Standard for Electrical Safety in the Workplace.

Buildings whose sole purpose is to house and protect power production facility equipment shall not be required to comply with Article 690.12. Written standard operating procedures shall be available at the site detailing necessary shutdown procedures in the event of an emergency.

691.10 Arc-Fault Mitigation.

PV systems that do not comply with the requirements of Article 690.11 shall be designed under engineering supervision that includes fire mitigation plans to address dc arc-faults.

691.11 Fence Grounding.

Fence grounding requirements and details shall be provided under engineering supervision.

Statement of Problem and Substantiation for Public Comment

1.) There are several terms used in the article taken from the National Electrical Safety Code (NESC) which provides requirements for generation, transmission, distribution and metering assets of electric utilities. One such term is "Supply Station" and for this article is best replaced with "Power Production Facility" to be consistent with terminology found in the National Electrical Code (NEC) associated with premises wiring in Article 705.

2.) It is common for 2000kW large Solar PV systems to be interconnected to primary voltage utility systems.

3.) "Solar Photovoltaic Power Production Facility" is more appropriately defined and used in this article for premises wiring systems than "Generating Station" which is a utility term.

4.) The definition and use of "Utility Distribution System" and "Utility Transmission System" is not necessary for premises wiring as these systems are specific to utilities. It would be more appropriate to make references to Article 225- Outside Branch Circuits and Feeders and Article 230- Services from the NEC.

5.) Equipment used for interconnection with an electric utility shall also be approved by the electric utility.

Public Comment No. 1613-NFPA 70-2015 [Section No. 691.1]

Scope.

This article covers the installation of large-scale PV electric supply stations operated by independent power producers for the sole purpose of providing electric supply to the utility transmission or distribution system with a generating capacity of no less than 5,000 kW. Electric supply stations are locations containing the generating stations and substations, including their associated generator, storage battery, transformer, and switchgear areas. Facilities covered by this article have specific design and safety features unique to large-scale PV facilities.

Informational Note: 90.2(B)(5) includes information about utility-owned properties not covered under this Code. For additional information on electric supply stations, see ANSI/IEEE C2-2012, National Electrical Safety Code.

Statement of Problem and Substantiation for Public Comment

Clarify that unless the owner is a regulated public utility they are not exempt from the requirements of this article.

Reduction of the 5000 KWh to 1000 KWh to allow for smaller ground mounted systems to make use of the reduced requirements of this article.

Informational Note: 90.2(B)(5) includes information about utility-owned properties not covered under this Code. For additional information on electric supply stations, see ANSI/IEEE C2-2012, National Electrical Safety Code.

Statement of Problem and Substantiation for Public Comment
The First Draft sets the entry level for the new Article 691 at 5000 kW, which is a very large system. Furthermore, the attributes of a PV plant that really matter for application of Art. 691 are interconnection at MV or HV, restricted access, and being ground mounted, not simply power. We feel that smaller systems that satisfy these other attributes should be allowed to use the approaches in Art. 691, and frequently already do (design and installation under engineering supervision for example).

Statement of Problem and Substantiation for Public Comment

The reference to transmission and distribution levels is vague in the definitions and really says that the interconnection to the utility is to be at 1000V or greater. Text is updated to state this and remove the reference to transmission and distribution. See comment on the definitions for Utility Transmission System and Utility Distribution System.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-975-NFPA 70-2015
Statement: The size of large-scale electric supply stations is maintained at the 5MW threshold for this code cycle to ensure that only systems that represent a significant investment, and therefore require significant engineering resources are included in the scope.

The term “transmission and distribution system” is deleted from the language in the scope and replaced with “for the transfer of electrical energy” to address concerns about the definition and use of transmission and distribution system.

Section 691.4, which articulates the distinctions between large scale PV and that covered by 690, is added to the scope so that it is clear how large-scale PV systems are distinguished from other PV systems.

The reference to ANSI/IEEE C2-2012 has been retained as it is useful to direct readers to the Code that is relevant to PV systems not covered by 690 or 691.
691.1 Scope.

This article covers the installation of large-scale PV electric supply stations operated for the sole purpose of providing electric supply to the utility transmission or distribution system with a generating capacity of no less than 5,000 kW. Electric supply stations are locations containing the generating stations and substations, including their associated generator, storage battery, transformer, and switchgear areas. Facilities covered by this article have specific design and safety features unique to large-scale PV facilities. This statement should be removed, unless the design and safety features are specifically defined which there not and if they were would be extremely limiting as all site locations are unique in nature regarding location and qualified personnel cannot be measured in a document but requires actual hands on training.

Informational Note: 90.2(B)(5) includes information about utility-owned properties not covered under this Code. For additional information on electric supply stations, see ANSI/IEEE C2-2012, National Electrical Safety Code. This IN should be removed as all these systems are privately owned property and exchange hands, sold, to different parties.

Statement of Problem and Substantiation for Public Comment
