The temperature of the surrounding medium; usually used to refer to the temperature of the air in which a structure is situated or a device operates.  

**SUBSTANTIATION:** Adoption of preferred definitions will assist the user by providing consistent meaning of defined terms throughout the National Fire Codes.  

**COMMITTEE ACTION:** Accept.  

1914-6 - (1-3 Approved): Accept  
**SUBMITTER:** Technical Committee on Fire Department Apparatus  
**RÉCOMMENDATION:** Delete the definition of "Approved."  
**SUBSTANTIATION:** The term is not used in the standard.  
**COMMITTEE ACTION:** Accept.  

1914-7 - (1-3 Authorized Person): Accept  
**SUBMITTER:** Technical Committee on Fire Department Apparatus  
**RÉCOMMENDATION:** Delete the definition of "Authorized Person."  
**SUBSTANTIATION:** The term is not used in the standard.  
**COMMITTEE ACTION:** Accept.  

1914-8 - (1-3 Collector Rings (GOT)): Accept  
**SUBMITTER:** Technical Committee on Fire Department Apparatus  
**RÉCOMMENDATION:** Adopt the preferred definitions from the NFPA Glossary of Terms for the following terms: Collector Rings (NFPA 70, 1999 ed.)  
An assembly of slip rings for transferring electrical energy from a stationary to a rotating member.  
**SUBSTANTIATION:** Adoption of preferred definitions will assist the user by providing consistent meaning of defined terms throughout the National Fire Codes.  
**COMMITTEE ACTION:** Accept.  

1914-9 - (1-3 Elevating Platform Apparatus): Accept  
**SUBMITTER:** Technical Committee on Fire Department Apparatus  
**RÉCOMMENDATION:** Delete the definition of "Elevating Platform Apparatus."  
**SUBSTANTIATION:** The terms "aerial ladder apparatus" and "water tower apparatus" are used in the document without definition and this term is used only once. The current definition can cause confusion with the use of the term elevating platform.  
**COMMITTEE ACTION:** Accept.  

1914-10 - (1-3 Inspect): Accept  
**SUBMITTER:** Technical Committee on Fire Department Apparatus  
**RÉCOMMENDATION:** Add a definition for the word "inspect" to read as follows:  
Inspect. To determine the condition or operation of a component(s) by comparing its physical, mechanical, and/or electrical characteristics with established standards, recommendations, and requirements through examination by sight, sound, or feel.  
**SUBSTANTIATION:** The word "inspect" is used without definition. The committee feels that where a major portion of the document deals with inspecting, the term should be defined. The definition is the same one that is used in NFPA 1915.  
**COMMITTEE ACTION:** Accept.  

1914-11 - (1-3 Labeled): Accept  
**SUBMITTER:** Technical Committee on Fire Department Apparatus  
**RÉCOMMENDATION:** Delete the definition of "Labeled."  
**SUBSTANTIATION:** The term is not used in the standard.  
**COMMITTEE ACTION:** Accept.
1914-12 - (1-3 Level): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Change the term "Level" in the definitions to "Spirit Level.
SUBSTANTIATION: The term "level" is used with a number of meanings in the document but this definition is for spirit level as used in 3-9-6 so changing the term is appropriate.
COMMITTEE ACTION: Accept.

1914-13 - (1-3 Listed): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Delete the definition of "Listed.
SUBSTANTIATION: The term is not used in the standard.
COMMITTEE ACTION: Accept.

1914-14 - (1-3 Override (GOT)): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Adopt the preferred definitions from the NFPA Glossary of Terms for the following terms:
Override (NFPA 1901, 1999 ed.)
SUBSTANTIATION: Adoption of preferred definitions will assist the user by providing consistent meaning of defined terms throughout the National Fire Codes.
COMMITTEE ACTION: Accept.

1914-15 - (1-3 Platform Load Capacity, 3-5.6 and 3-11.3): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Delete the definition of "Platform Load Capacity" and "Payload.
SUBSTANTIATION: In 3-5.6, change the term "Platform Load Capacity" to "Elevating Platform Rated Capacity"
In 3-11.3, change the phrase “manufacturer’s rated payload capacity” to “the elevating platform’s rated capacity.”
COMMITTEE ACTION: Accept.

1914-16 - (1-3 Properly): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Revise the definition of “Properly” to read as follows:
Properly. In accordance with the manufacturer’s specifications or as recommended by the manufacturer.
SUBSTANTIATION: The terms “proper” and “properly” are used throughout the document. A review of the use of the terms shows that in some cases, they are used to indicate that something is in accordance with the manufacturer’s specifications so the definition is being changed.
COMMITTEE ACTION: Accept.

1914-17 - (1-3 Rated Vertical Height): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Revise the definition of “Rated Vertical Height” to read:
The vertical distance measured by a plumb line from the rated working height, maximum elevation allowed by the manufacturer to the ground. For an aerial ladder, it is measured from the top rung of the fly section; for an aerial with an elevating platform, it is measured from the top of the platform handrails to the ground;
and for a water tower, it is measured from the discharge end of the monitor nozzle. All measurements are taken at the maximum elevation allowed by the original equipment manufacturer (OEM) and published in the operator’s manual.
SUBSTANTIATION: The term rated working height is not defined and the changes make the terminology consistent while shortening the definition.
COMMITTEE ACTION: Accept.

1914-18 - (1-3 Relief Valve): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Revise the definition of relief valve as shown.
RELIEF VALVE. A pressure-controlling device that allows the bypass of hydraulic fluids to limit the pressures in a hydraulic system.
SUBSTANTIATION: The current definition is too limiting as the term “relief valve” is used in the document in relationship to water system as well as hydraulic systems. The revised definition is more generic and can apply to all relief valves as a fluid can be either a gas or liquid.
COMMITTEE ACTION: Accept.

1914-19 - (1-3 Stability): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Delete the definition of “Stability” and make the current second and third sentences of the definition an appendix to the definition of “instability.” The second and third sentences read as follows:
“The lifting of a tire or stabilizer on the opposite side of the vehicle from the load does not necessarily indicate a condition of instability. Instability occurs when an aerial device can no longer support a given load and overturning is imminent.”
SUBSTANTIATION: The only use of the word “stability” in the document is as an adjective. The second and third sentences of the current definition are good explanatory information for the definition of “instability.”
COMMITTEE ACTION: Accept.

1914-20 - (1-3 Test): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Add a definition for the word “Test” to read as follows:
Test. To verify serviceability by measuring the mechanical, pneumatic, hydraulic, or electrical characteristics of an item and comparing those characteristics with prescribed standards.
SUBSTANTIATION: The word “test” is used in the document without definition. The committee feels that, where a major portion of the document deals with testing, the term should be defined. The definition is the same one that is used in NFPA 1915.
COMMITTEE ACTION: Accept.

1914-21 - (1-3 Turntable): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Revise the definition of “Turntable” to read as follows:
“A structural component that connects the aerial device to the chassis and stabilization system through a rotating bearing that permits 360 degree continuous rotation of the aerial device.”
Add an appendix to read:
“Some turntables contain an operator’s control station.”
SUBSTANTIATION: The current definition is awkward. The issue of the operator control station is not really a part of the definition but rather a point of information and so is being moved to the appendix.
COMMITTEE ACTION: Accept.
COMMITTEE ACTION: Accept.

1914-22 - (1-4.1): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Delete the word “visual” so the sentence reads: “The inspections, operational tests, and load tests specified in this standard shall be conducted at least annually; after major repairs or overhaul; following the use of the aerial device when the aerial device could have been subjected to unusual operating conditions, or stress or load; or when there is reason to believe that usage has exceeded the manufacturer’s recommended aerial device operating procedures.”
SUBSTANTIATION: Visual inspections are specific inspections required by the standard but the inspections intended to be carried out as required by 1-4.1 are broader than just visual inspections. Removing the word “visual” broadens the interpretation to cover the intent of the standard.
COMMITTEE ACTION: Accept.

1914-23 - (1-4.5): Accept in Principle
SUBMITTER: David A. Ogilvie, Pierce Manufacturing Inc.
RECOMMENDATION: Add text to read as follows: “1-4.5 Only qualified persons...to conduct any load tests.”
COMMITTEE ACTION: Accept in Principle.
COMMITTEE STATEMENT: The committee has reworded the wording for the qualification of inspection personnel in Section 1-5. The change to the second paragraph of the existing 1-5 is to separate agency evaluation from personnel evaluation. The definition of Level II (ASNT) is being deleted as the ASNT reference is not appropriate and the qualifications for levels I, II and III are in ASNT CP-189 which is referenced so a definition is not necessary.
COMMITTEE ACTION: Accept.

1914-24 - (1-5): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Revise the first paragraph of 1-5 to read as follows:
1-5. Inspection Personnel. The inspections and tests outlined in this standard shall be performed by qualified persons, a third-party testing company or the manufacturer as determined acceptable by the authority having jurisdiction. The person actually performing the nondestructive test work shall be certified as at least a Level II NDT technician in the test method used, as specified in ASNT CP-189, Standard for Qualification and Certification of Nondestructive Testing Personnel. Trainees and personnel certified to Level I in the test method used shall be permitted to conduct the nondestructive tests so long as they work under the direct and immediate supervision of either a Level II or an ASNT Level III technician holding current certification in the same test method.
Make the second paragraph of 1-5 a separate section with a title of “Third Party Test Companies.”
Delete the wording “or to conduct any load tests” from the end of 1-4.5.
Delete the definition of Level II (ASNT) in 1-3.

SUBSTANTIATION: The first two sentences of existing 1-5 have been changed to allow any qualified persons acceptable to the authority having jurisdiction to conduct inspections and tests, not just fire department personnel. This brings all the inspection and testing personnel qualification under Section 1-5. With this change, 1-4.5 can deal strictly with operating the apparatus during the testing and thus the wording dealing with qualified persons conducting load tests is being deleted.
The current wording in the third sentence of 1-5 is too restrictive as it allows only personnel certified as Level II in a given method to conduct NDT on aerial devices. This makes training and certification of new personnel difficult at best, as the current language does not allow for gaining experience prior to certification as a Level II. Further, use of the initials “ASNT” in conjunction with a level designation indicates that the individual has been certified, by test, by American Society for Nondestructive Testing (ASNT). The NDT personnel certification document (ASNT CP-189) fully recognizes this format for training and on the job work experience by the requirements outlined in CP-189 for the progression from Trainee to ASNT Level III. The document requires that Trainees and Level I personnel work under the direct supervision of Level II or Level III personnel, that all experience be documented and traceable, and that progression from level to level be granted only upon successful completion of written and practical certification tests.
ASNT CP-189 specifies that a Level III must hold written certification from ASNT, gained by successfully completing written tests given by ASNT. Those individuals are referred to as an “ASNT Level III” to distinguish them from personnel holding Level III certification gained only by the employers certification tests. The change to the second paragraph of the existing 1-5 is to separate agency evaluation from personnel evaluation. The reference to chapters 2, 3 and 4 direct the user to the specifics of the visual inspection. The other changes clarify that the visual inspections are to be done prior to the operational and load tests and editorially clean up the requirement.
COMMITTEE ACTION: Accept.

1914-25 - (1-6): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Revise 1-6 to read as follows:
“A visual inspection shall be performed in accordance with the requirements of Chapters 2, 3 or 4 depending on the aerial device. The visual inspection shall be conducted prior to any operational or load testing, and shall be carried out in a systematic sequence with proper attention to detail. This visual inspection of the equipment shall be for the detection of any visible defects, damage, or improperly secured parts.”

SUBSTANTIATION: The references to chapters 2, 3 and 4 direct the user to the specifics of the visual inspection. The other changes clarify that the visual inspections are to be done prior to the operational and load tests and editorially clean up the requirement.
COMMITTEE ACTION: Accept.

1914-26 - (1-7): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Revise 1-7 to read as follows:
“All structural welds shall comply with the weld quality as defined in 4.11.7.1, the visual inspection acceptance criteria of AWS D1.1.”

REVISE 1-7 TO READ AS FOLLOWS:
All structural welds shall comply with the weld quality as defined in 4.11.7.1, the visual inspection acceptance criteria of AWS D1.1.”

REVISE THE SECOND SENTENCE OF 1-7 TO READ AS FOLLOWS:
All structural welds shall comply with the weld quality as defined in 4.11.7.1, the visual inspection acceptance criteria of AWS D1.1.”

REVISE THE SECOND SENTENCE OF 1-7 TO READ AS FOLLOWS:
All structural welds shall comply with the weld quality as defined in 4.11.7.1, the visual inspection acceptance criteria of AWS D1.1.”

SUBSTANTIATION: See proposal 1914- (Log #28) which revises the wording for the qualification of inspection personnel in Section 1-5. The changes to Section 1-7 are to remove specific references to sections in AWS D1.1 and AWS D1.2 and generically specify the sections that are to be used.

COMMITTEE ACTION: Accept.
1914-27 - (1-8): Accept
SUBMITTER: Jim Johannessen, Underwriters Laboratories Inc.
RECOMMENDATION: Delete the following text: "All washers shall be inspected for correct installation."
SUBSTANTIATION: There is insufficient information on the correct way to install washers.
COMMITTEE ACTION: Accept.

1914-28 - (Chapter 2, Title): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RÉCOMMENDATION: Change the title of Chapter 2 to “Inspecting and Testing Aerial Ladders.”
SUBSTANTIATION: The requirements of this chapter are broader than just testing and so the title change reflects that there is also an inspection component.
COMMITTEE ACTION: Accept.

1914-29 - (2-1, 3-1 and 4-1): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RÉCOMMENDATION: Revise text to read as follows: “In addition to the manufacturer’s recommendations for annual inspections and tests, the inspections and tests detailed below shall be performed.”
SUBSTANTIATION: The revised wording clarifies what manufacturer’s recommendations are being referenced.
COMMITTEE ACTION: Accept.

1914-30 - (2-2, 3-2, and 4-2): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RÉCOMMENDATION: Delete the word “could” from the sentence.
SUBSTANTIATION: The word “could” is a subjective word and the sentence provides a clearer requirement without it.
COMMITTEE ACTION: Accept.

1914-31 - (2-3): Accept in Principle
SUBMITTER: Tom Hillenbrand, Underwriters Laboratories Inc.
RECOMMENDATION: Revise text to read as follows: “Turntable, Torque Box and Tiller Inspection and Test. The turntable, torque box, and tiller components, (i.e. gooseneck, trailer, etc.)…”
SUBSTANTIATION: Tractor drawn aerial devices are not specifically addressed in the Standard.
COMMITTEE ACTION: Accept in Principle.

1914-32 - (2-3, (a), (b) (New) ): Accept in Principle
SUBMITTER: Jim Johannessen, Underwriters Laboratories Inc.
RECOMMENDATION: Add text to read as follows: “Torque Box Structural Components. The torque box structural components shall be inspected as follows: (a) Visually inspect all of the accessible torque box structural weldments for defects and all of the welds for fractures. (b) (+) Inspect all accessible torque box structural component welds.”

1914-33 - (2-3.3 (New) ): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RÉCOMMENDATION: Add two new paragraphs after 2-3.2 to read as follows: 2-3.3 Driven Components Mounting to Frame. 2-3.3.1 If driven components are bolted to the frame, the mounting of the driven components to the frame shall be inspected as follows: (a) Inspect all accessible bolts for proper grade and installation as specified by the apparatus manufacturer. (b) Using a properly calibrated torque wrench, verify that the torque on all accessible bolts meets the apparatus manufacturer’s specifications. 2-3.4 Suspension System. 2-3.4.1 If the suspension system components are bolted to the frame, the mounting of the suspension system components to the frame shall be inspected as follows: (a) Inspect all accessible bolts for proper grade and installation as specified by the apparatus manufacturer. (b) Using a properly calibrated torque wrench, verify that the torque on all accessible bolts meets the apparatus manufacturer’s specifications. 2-3.4.2 If the suspension system components are welded to the frame, the mounting of the suspension system components to the frame shall be inspected as follows: (a) Visually inspect all accessible attaching welds for fractures. (b) (+) Inspect all accessible attaching welds.

1914-34 - (2-3.3(b) ): Accept in Principle
SUBMITTER: Randy Zimmer, Pierce Manufacturing Inc.
RECOMMENDATION: Delete the following text: “2-3.3 (b) Record the inner bearing race to outer bearing race.”
SUBSTANTIATION: These additions are to require the proper inspection of tractor drawn components and suspension system components. See also Committee Action on Proposal 1914-31 (Log #15) which changes the title of the section.
COMMITTEE ACTION: Accept.

1914-35 - (2-3.7): Accept in Principle
SUBMITTER: Tom Hillenbrand, Underwriters Laboratories Inc.
RECOMMENDATION: Revise text to read as follows: “Hydraulic Lines and Hoses in Turntable, Chassis and Torque Box.”
SUBSTANTIATION: This is an area for damaged hydraulic lines and hoses, and hydraulic fluid leakage.
COMMITTEE ACTION: Accept in Principle.

Change the title of 2-3.7 to Hydraulic Lines and Hoses.
COMMITTEE STATEMENT: All hydraulic lines and hoses should be inspected. This is in Section 2-3 which is being retitled as Turntable, Torque Box, Suspension, and Tractor Drawn Componentry Inspection and Test.

1914-36 - (2-3-8(b), (c), and (d)): Accept

SUBMITTER: Technical Committee on Fire Department Apparatus

RECOMMENDATION: Revise 2-3.8 (b), (c) and (d) to read as follows:

(a) Verify by visual inspection that the manual valve elevation lock operates properly by engaging the lock and then attempting to raise and lower the ladder while the main hydraulic system is operating.

(b) Verify by visual inspection that the manual valve extension lock operates properly by engaging the lock and then attempting to extend or retract the ladder while the main hydraulic system is operating.

(c) Verify by visual inspection that the manual valve rotation lock operates properly by engaging the lock and attempting to rotate the turntable clockwise and counterclockwise while the main hydraulic system is operating.

(d) Verify by visual inspection that the manual valve rotation lock operates properly by engaging the lock and attempting to rotate the turntable clockwise and counterclockwise while the main hydraulic system is operating.

SUBSTANTIATION: These subparagraphs are being rewritten to be a single statement. By saying that it should be inspected to ensure that it operates properly, the implication by definition is that it meets the manufacturer’s specification.

COMMITTEE ACTION: Accept.

1914-37 - (2-3-9): Accept

SUBMITTER: Randy Zimmmer, Pierce Manufacturing Inc.

RECOMMENDATION: Add text to read as follows:

"2-3.9...and subject the sample of the hydraulic oil to spectrochemical analysis, particle count, viscosity check and water content analysis."

SUBSTANTIATION: The information attained from these additional tests is helpful in identifying any system problems.

COMMITTEE ACTION: Accept.

1914-38 - (2-3-12) (New): Accept in Principle

SUBMITTER: Randy Zimmer, Pierce Manufacturing Inc.

RECOMMENDATION: Add text to read as follows:

2-3.12 (d) Check for indication of moisture in the electrical chamber by visually inspecting the desiccant moisture indicators, if applicable.

SUBSTANTIATION: The presence of moisture can be damaging to the collector ring circuits.

COMMITTEE ACTION: Accept in Principle.

Add text to 2-3.12 to read as follows:

(d) If applicable, check for indication of moisture in the electrical chamber by visually inspecting the desiccant moisture indicators.

COMMITTEE STATEMENT: The committee has just editorially put the words "if applicable" at the beginning of the sentence instead of the end.

1914-39 - (2-3-13(c), (d), (e) (New)): Accept

SUBMITTER: Jim Johannessen, Underwriters Laboratories Inc.

RECOMMENDATION: Add text to read as follows:

(c) If the elevation cylinder anchor is bolted, inspect all accessible bolts for internal flaws.

(d) Using a properly calibrated torque wrench, verify that the bolt torque on all accessible bolts meets the manufacturers specification.

(e) Inspect all accessible bolts for internal flaws.

SUBSTANTIATION: Based on historical test data, many of these components are bolted together.

COMMITTEE ACTION: Accept.
1914- 44 - (2-3.23): Reject
SUBMITTER: Jim Johannessen, Underwriters Laboratories Inc.
RECOMMENDATION: Revise text to read as follows:
"...and operation at all points (turntable, pump panel, and platform, when applicable)."
SUBSTANTIATION: Communication systems exist in more than two locations.
COMMITTEE ACTION: Reject.
COMMITTEE STATEMENT: The committee feels the current wording covers the communication system at all operating positions.

1914- 45 - (2-3.24): Accept in Principle
SUBMITTER: Randy Zimmer, Pierce Manufacturing Inc.
RECOMMENDATION: Add text to read as follows:
2-3.24 Relief Hydraulic Pressure. Verify that the main pump relief hydraulic pressure and compensated pump pressure setting do not exceed the manufacturer’s specifications.
SUBSTANTIATION: Many hydraulic systems have a compensated pump pressure setting in addition to a secondary relief setting. This paragraph should include both checks.
COMMITTEE ACTION: Accept in Principle.
COMMITTEE STATEMENT: Revise 2-3.24 to read as follows:
"Relief Hydraulic Pressure. The main hydraulic pump relief pressure and the compensator pressure shall be tested to determine they do not exceed the manufacturer’s specifications."
COMMITTEE STATEMENT: The committee has revised the suggested wording for editorial clarification.

1914- 46 - (2-3.26 and 2-3.27): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RECOMMENDATION: Revise 2-3.26 to read as follows:
2-3.26 Transmission/Aerial Device Interlocks. If interlocks have been provided which prevent operation of the aerial device until both the parking chassis spring brakes have been set and the transmission has been positioned disengaged properly, verify that the interlocks are operating properly.
2-3.27 Engine Speed Interlocks. If interlocks have been provided which allow operation of the engine speed control only after both the parking spring brakes have been set and the transmission has been positioned properly, verify that the interlocks are operating properly.
SUBSTANTIATION: Spring brakes is an old term for parking brakes. Also in 2-3.26, the transmission should be in the proper position for aerial device operation, not disengaged.
COMMITTEE ACTION: Accept.

1914- 47 - (2-4.7): Accept
SUBMITTER: Technical Committee on Fire Department Apparatus
RÉCOMMÉNATION: Revise 2-4.7 to read as follows:
2-4.7 Stabilizer Extension Cylinder.
2-4.7.1 The stabilizer extension cylinder shall be inspected as follows:
(a) Inspect the stabilizer extension cylinder rods for pitting, scoring, and other defects.
(b) Inspect the cylinder rod-to-barrel seal and the end gland seal for external hydraulic fluid leakage that exceeds the manufacturer’s specifications.
2-4.7.2 The stabilizer extension cylinder shall be subjected to a drift test as follows:
(a) With the hydraulic oil at ambient temperature, properly set the stabilizer’s cylinders.
(b) Mark the cylinder position.
(c) Measure the drift after 1 hour with the engine off.
(d) Verify that the results do not exceed the manufacturer’s specification for allowable stabilizer cylinder drift.
SUBSTANTIATION: The paragraph is being revised to cleanup the style and separate the inspection from the test. In addition the word “excessive” is being replaced with “exceeds manufacturer’s specifications” as the word “excessive” is not definitive.
COMMITTEE ACTION: Accept.

1914- 48 - (2-4.9): Accept in Principle
SUBMITTER: Jim Johannessen, Underwriters Laboratories Inc.
RECOMMENDATION: Revise text to read as follows:
"...do not bind during operation, inspect operating controls for identification of function, posted operating instructions, and warnings, and are free of hydraulic fluid leakage."
SUBSTANTIATION: To be consistent with operating controls (2-3.17 & 3-5.9).
COMMITTEE ACTION: Accept in Principle.
COMMITTEE STATEMENT: Revise 2-4.9 to read as follows:
"Operating Controls. The operating controls shall be inspected as follows:
(a) Inspect the operating controls for missing or damaged control handles, identification of functions, posted operating instructions and warnings, and hydraulic fluid leakage.
(b) Verify that the controls operate smoothly, return to neutral when released, and do not bind during operation."
Also revise 2-3.17 (a) to read as follows:
(a) Inspect the operating controls for missing or damaged control handles, identification of functions, posted operating instructions and warnings, and hydraulic fluid leakage.
Also revise 3-5.9(a) to read as follows:
(a) Inspect the platform operating controls for missing or damaged control handles, identification of functions, and posted operating instructions and warnings.
COMMITTEE STATEMENT: The committee reviewed 2-3.17(a), 2-4.9(a) and 3-5.9(a) and developed wording to be consistent between the three. The change to 2-4.9(b) is for consistency with 2-3.17(b) and 3-5.9(b).

1914- 49 - (2.5): Accept in Principle
SUBMITTER: Tom Hillenbrand, Underwriters Laboratories Inc.
RECOMMENDATION: Add text to read as follows:
"Modifications or Unauthorized Repairs. Inspect the aerial device for modifications or repairs unauthorized by the manufacturer."
SUBSTANTIATION: Currently this is only addressed under the platform section 3-5.10 and should be applied to aerial devices as well.
COMMITTEE ACTION: Accept in Principle.
COMMITTEE STATEMENT: The committee agrees with the submitter but feels the aerial ladder should also be inspected for added equipment (weight) without that weight being subtracted from the rated capacity, and that the results should be detailed in the inspection and test of the aerial ladder. The term “unauthorized” is being changed to “improper” as it is not always possible to determined if something is authorized or not, but a judgment can be made as to whether it is proper or not.

1914- 50 - (2.5, (a), (b) (New) ): Accept
SUBMITTER: Tom Hillenbrand, Underwriters Laboratories Inc.
RECOMMENDATION: Add text to read as follows:
"Vertical/Diagonal Braces. The vertical and diagonal braces shall be inspected as follows:
(a) Inspect the verticals and diagonals for straightness, dents, and other deformities.
(b) Inspect all accessible attachment welds."
SUBSTANTIATION: The vertical/diagonals have been identified as potential problem areas for structural damage and should be inspected.
COMMITTEE ACTION: Accept.
COMMITTEE STATEMENT: Add this new material after existing 2-5.5.
1914-51 - (2-5.17): Accept  
SUBMITTER: Jim Johannessen, Underwriters Laboratories Inc.  
RECOMMENDATION: Revise text to read as follows:  
“Extension, Elevation, and Rung Alignment Indicators. Inspect the elevation, extension, and rung alignment indicators for...”  
SUBSTANTIATION: When the rung alignment indicator is not working properly, there is a potential hazard for climbing the aerial ladder.  
COMMITTEE ACTION: Accept.

1914-52 - (2-5.19, (a) through (f) (New)): Accept  
SUBMITTER: Tom Hillenbrand, Underwriters Laboratories Inc.  
RECOMMENDATION: Revise text to read as follows:  
2-5.19 Ladder Cradle. Inspect: The aerial ladder cradle for wear and proper alignment shall be inspected as follows:  
(a) Inspect the ladder cradle for wear, proper alignment, and the cradle pad for damage.  
(b) Visually inspect the ladder cradle for defects such as weld cracks, dents, or bends.  
(c) (+) Inspect the ladder cradle welds and brackets attachments.  
(d) If the ladder cradle is bolted inspect all accessible bolts for proper grade and installation as specified by the apparatus manufacturer.  
(e) Using a properly calibrated torque wrench, verify that the bolt torque on all accessible mounting bolts meets the apparatus manufacturer’s specification.  
(f) (+) Inspect all accessible bolts for internal flaws.  
SUBSTANTIATION: To be consistent with boom support (3-6.12). The cradle and attachment welds have been found to contain notable defects. Many cradles are bolted as well as welded together.  
COMMITTEE ACTION: Accept.

1914-53 - (2-5.22): Accept in Principle  
SUBMITTER: Randy Zimmer, Pierce Manufacturing Inc.  
RECOMMENDATION: Add text to read as follows:  
2-5.22 Maximum Extension Warning Device. During operation of the aerial ladder, verify (if so equipped) the proper operation of the audible device that warns of the approach of maximum extension.  
SUBSTANTIATION: Reference paragraph 3-8.7  
COMMITTEE ACTION: Accept in Principle.  
Revise 2-5.22 to read as follows:  
“The security and adjustment of the ladder cables or chains shall be checked for proper tension and retention per the manufacturer’s specifications.”

1914-54 - (2-5.24(c), (d), (e) (New)): Accept  
SUBMITTER: Jim Johannessen, Underwriters Laboratories Inc.  
RECOMMENDATION: Add text to read as follows:  
(c) If the extension cylinder anchor is bolted, inspect all accessible bolts for proper grade and installation as specified by the apparatus manufacturer.  
(d) Using a properly calibrated torque wrench, verify that the bolt torque on all accessible bolts meets the manufacturer’s specification.  
(e) (+) Inspect all accessible bolts for internal flaws.  
SUBSTANTIATION: Based on historical test data, some of these components are bolted together.  
COMMITTEE ACTION: Accept.

1914-55 - (2-5.26): Accept  
SUBMITTER: Technical Committee on Fire Department Apparatus  
RECOMMENDATION: Revise 2-5.26 to read as follows:  
5.5.26.1 The extension cylinders shall be inspected as follows:  
(a) Inspect the cylinder rods for pitting, scoring, and other defects.  
(b) Inspect the cylinder rod-to-barrel seal and the end gland seal for external hydraulic fluid leakage that exceeds the manufacturer’s specifications.  
5.5.26.2 The extension cylinder shall be subjected to a drift test as follows:  
(a) With the hydraulic oil at ambient temperature, place the aerial device at full elevation and 10 ft (3 m) of extension.  
(b) Mark the cylinder piston or the second section in relation to the base section.  
(c) Allow the ladder to stand for 1 hour with the engine off.  
(d) Measure the drift and verify that the results do not exceed the manufacturer’s specifications for allowable cylinder drift.  
SUBSTANTIATION: The paragraph is being revised to cleanup the style and separate the inspection from the test. In addition the word “excessive” is being replaced with “exceeds manufacturer’s specifications” as the word “excessive” is not definitive.  
COMMITTEE ACTION: Accept.

1914-56 - (2-5.28): Accept in Principle  
SUBMITTER: Randy Zimmer, Pierce Manufacturing Inc.  
RECOMMENDATION: Revise text in 2-5.28 (e) to read as follows:  
(e) Verify that the speed of the aerial ladder, when being operated from the tip controls, does not exceed the aerial ladder manufacturer’s allowable speed.  
SUBSTANTIATION: This would make sense considering how much review this subject was given in NFPA 1901.  
COMMITTEE ACTION: Accept in Principle.  
Revise 2-5.28 (e) to read as follows:  
(e) Verify that the speed of the aerial ladder, when being operated from the tip controls, does not exceed the speeds identified in NFPA 1901.  
COMMITTEE STATEMENT: The committee does not feel it is appropriate to reference a specific paragraph in NFPA 1901 as that could change over time.

1914-57 - (2-6.2, 3-9.8.1 and 4-9.2): Accept  
SUBMITTER: Technical Committee on Fire Department Apparatus  
RECOMMENDATION: Revise 2-6.2 to read as follows:  
“The aerial ladder shall complete the procedure defined in 2-6.1 smoothly and without undue vibration within the time allowed by the edition of NFPA 1901 in effect at the time of manufacture.”  
Revise the second sentence of 3-9.8.1 to read as follows:  
“The elevating platform shall complete the procedure defined in 6.10.7.1 smoothly and without undue vibration within the time allowed by the edition of NFPA 1901 in effect at the time of manufacture.”  
Revise 4-9.2 to read as follows:  
“The water tower shall complete the procedure defined in 4-9.1 smoothly and without undue vibration within the time allowed by the edition of NFPA 1901 in effect at the time of manufacture.”  
SUBSTANTIATION: These changes will make the wording of the paragraph relating to aerial ladders, elevating platforms, and water towers consistent and will refer specifically to the edition of NFPA 1901 in effect at the time of manufacture.  
COMMITTEE ACTION: Accept.

1914-58 - (2-6.3): Accept  
SUBMITTER: Technical Committee on Fire Department Apparatus  
RECOMMENDATION: Revise the last sentence of 2-6.3 to read as follows:  
“The security and adjustment of the ladder cables or chains shall be checked for proper tension and retention per the manufacturer’s specifications.”  
SUBSTANTIATION: The current wording is ambiguous and the revised wording clarifies the intent.  
COMMITTEE ACTION: Accept.
REVISE 2-7.4.3 TO READ AS FOLLOWS:  
"The maximum rated capacity live load that the ladder is designed to support in the maximum-elevated position at full extension shall be determined from the manufacturer's load chart or operator's manuals."  
Revise 2-7.4.9 to read as follows.  
"A free-hanging weight that is equal to the manufacturer's specified rated capacity live load, as determined in 2-7.4.3, shall be applied gradually to the top rung of the aerial ladder by utilizing a test weight container or other suitable means of applying the weight. The weight shall be suspended by a cable and shall not be more than 3 ft (1 m) above the ground. The combined weight of the test cable hanger and cable, the test weight container, and the test weights shall not exceed the rated capacity live load."  
Delete the definition of "Live Load" in 1-3.  
SUBSTANTIATION:  The committee is changing the term "live load" to rated capacity for consistency of terminology within the document. The other changes are editorial for clarity.  
COMMITTEE ACTION: Accept.  

REVISE 2-7.4.9 TO READ AS FOLLOWS:  
"The maximum rated capacity live load that the ladder is designed to support in the maximum-elevated position at full extension shall be determined from the manufacturer's load chart or operator's manuals."  
Revise 2-7.4.9 to read as follows.  
"A free-hanging weight that is equal to the manufacturer's specified rated capacity live load, as determined in 2-7.4.3, shall be applied gradually to the top rung of the aerial ladder by utilizing a test weight container or other suitable means of applying the weight. The weight shall be suspended by a cable and shall not be more than 3 ft (1 m) above the ground. The combined weight of the test cable hanger and cable, the test weight container, and the test weights shall not exceed the rated capacity live load."  
Delete the definition of "Live Load" in 1-3.  
SUBSTANTIATION:  The committee is changing the term "live load" to rated capacity for consistency of terminology within the document. The other changes are editorial for clarity.  
COMMITTEE ACTION: Accept.  

REVISE 2-7.4.9 TO READ AS FOLLOWS:  
"The maximum rated capacity live load that the ladder is designed to support in the maximum-elevated position at full extension shall be determined from the manufacturer's load chart or operator's manuals."  
Revise 2-7.4.9 to read as follows.  
"A free-hanging weight that is equal to the manufacturer's specified rated capacity live load, as determined in 2-7.4.3, shall be applied gradually to the top rung of the aerial ladder by utilizing a test weight container or other suitable means of applying the weight. The weight shall be suspended by a cable and shall not be more than 3 ft (1 m) above the ground. The combined weight of the test cable hanger and cable, the test weight container, and the test weights shall not exceed the rated capacity live load."  
Delete the definition of "Live Load" in 1-3.  
SUBSTANTIATION:  The committee is changing the term "live load" to rated capacity for consistency of terminology within the document. The other changes are editorial for clarity.  
COMMITTEE ACTION: Accept.  

REVISE 2-7.4.9 TO READ AS FOLLOWS:  
"The maximum rated capacity live load that the ladder is designed to support in the maximum-elevated position at full extension shall be determined from the manufacturer's load chart or operator's manuals."  
Revise 2-7.4.9 to read as follows.  
"A free-hanging weight that is equal to the manufacturer's specified rated capacity live load, as determined in 2-7.4.3, shall be applied gradually to the top rung of the aerial ladder by utilizing a test weight container or other suitable means of applying the weight. The weight shall be suspended by a cable and shall not be more than 3 ft (1 m) above the ground. The combined weight of the test cable hanger and cable, the test weight container, and the test weights shall not exceed the rated capacity live load."  
Delete the definition of "Live Load" in 1-3.  
SUBSTANTIATION:  The committee is changing the term "live load" to rated capacity for consistency of terminology within the document. The other changes are editorial for clarity.  
COMMITTEE ACTION: Accept.
1914-70 - (3-9.3): Accept  
SUBMITTER: Technical Committee on Fire Department Apparatus  
RECOMMENDATION: Delete paragraph 3-9.3.  
SUBSTANTIATION: This is a very subjective evaluation which cannot be measured consistently.  
COMMITTEE ACTION: Accept.

1914-71 - (3-9.8.2): Accept  
SUBMITTER: Technical Committee on Fire Department Apparatus  
RECOMMENDATION: Delete the last sentence of 3-9.8.2.  
SUBSTANTIATION: The sentence implies that something extra has to be done to the platform leveling system without stating what. The previous sentence states that a thorough inspection shall be made of all moving parts. The platform leveling system is comprised of moving parts. The last sentence is not needed.  
COMMITTEE ACTION: Accept.

1914-72 - (3-11.1 and 3-11.2): Accept  
SUBMITTER: Technical Committee on Fire Department Apparatus  
RECOMMENDATION: Replace 3-11.1 and 3-11.2 with the following:  
3-11.1 The aerial apparatus shall be positioned on a hard, level surface with room for unrestricted boom movements. The stabilizers shall be deployed in accordance with the manufacturers instructions.  
3-11.2 A close watch shall be maintained during all load tests for any signs of instability, the development of conditions that could cause damage or permanent deformation, or twist that exceeds the elevating platform manufacturers allowance. The test shall be discontinued immediately if such conditions develop. Delete 3-11.5.  
SUBSTANTIATION: The change to 3-11.1 is for consistency in wording with 2-7.3.1 revised (see proposal 1914- (Log #CP47). This combines current 3-11.1 and 3-11.2. The wording for 3-11.2 is to pick up wording in the elevating platform consistent with 2-7.2 as it addresses watching for signs of instability, conditions that could cause damage or permanent deformation, or twist that exceeds the aerial ladder manufacturers allowance. The requirement of 3-11.5 is in the new 3-11.2 so that paragraph can be deleted.  
COMMITTEE ACTION: Accept.

1914-73 - (3-12.6): Accept in Principle  
SUBMITTER: Tom Hillenbrand, Underwriters Laboratories Inc.  
RECOMMENDATION: Revise text to read as follows:  
"If the waterway system is equipped with a relief valve(s), the relief valve(s) shall be checked...".  
SUBSTANTIATION: Many platforms are equipped with separate relief valves and should be verified that they are operational at the manufacturer’s recommended pressure setting.  
COMMITTEE ACTION: Accept in Principle.  
REVISE text to read as follows:  
"If the waterway system is equipped with a relief valve(s), the relief valve(s) shall be checked...".  
COMMITTEE STATEMENT: The committee feels it can accomplish the same intent by using a “(s)” behind the word valve to denote there could be more than one.  

1914-74 -(Chapter 4, Title): Accept  
SUBMITTER: Technical Committee on Fire Department Apparatus  
RECOMMENDATION: Change the title of Chapter 4 to “Inspecting and Testing Water Towers”  
SUBSTANTIATION: The requirements of this chapter are broader than just testing and so the title change reflects that there is also an inspection component.  
COMMITTEE ACTION: Accept.
RECOMMENDATION: Update the edition of the standards referenced in 5-1.2 as follows:
- Update the edition of the standards referenced in 5-1.3 as follows:
- Update the edition of the standards referenced in 5-1.4 as follows:

SUBSTANTIATION: The latest edition of the referenced standards should be used in the testing of aerial devices.

COMMITTEE ACTION: Accept.
Chapter 1 Administration

1.1 Scope. This standard shall apply to the inspection and testing of all fire apparatus, regardless of year of manufacture, that are equipped with an aerial ladder, an elevating platform, or a water tower.

1.2 Purpose. Since aerial devices could become damaged and overstressed, the purpose of this standard shall be to specify the minimum inspection and testing requirements for aerial devices in an effort to ensure at least a minimum degree of safety under continued use.

1.3 Equivalency. Nothing in this standard shall prevent the use of systems, methods, or devices of equivalent or superior quality, strength, fire resistance, effectiveness, durability, and safety over those prescribed by this standard. Technical documentation shall be submitted to the authority having jurisdiction to demonstrate equivalency. The system, method, or device shall be approved for the intended purpose by the authority having jurisdiction.

Chapter 2 Referenced Publications

2.1 General. The documents or portions thereof listed in this chapter are referenced within this standard and shall be considered part of the requirements of this document.

2.1.1 NFPA Publication. National Fire Protection Association, 1 Batterymarch Park, P.O. Box 9101, Quincy, MA 02269-9101.

2.1.2 Other Publications.

2.1.2.1 ASNT Publication. American Society for Nondestructive Testing, Inc., 1711 Arlingate Lane, Columbus, OH 43228-0518.

2.1.2.2 ASTM Publications. American Society for Testing and Materials, 100 Barr Harbor Drive, West Conshohocken, PA 19428-2959.

2.1.2.3 AWS Publications. American Welding Society, Inc., 550 NW LeJeune Road, Miami, FL 33126.

2.1.2.4 SAE Publication. Society of Automotive Engineers, 400 Commonwealth Drive, Warrendale, PA 15096.

Chapter 3 Definitions

3.1 General. The definitions contained in Chapter 3 apply to the terms used in this standard. Where terms are not included in Chapter 3, common usage of the term applies.

3.2 Official NFPA Definitions.

3.2.1* Authority Having Jurisdiction. The organization, office, or individual responsible for approving equipment, materials, an installation, or a procedure.

3.2.2 Shall. Indicates a mandatory requirement.

3.2.3 Should. Indicates a recommendation or that which is advised but not required.

3.3 General Definitions.

3.3.1 Acoustic Emission Testing. A method of nondestructive testing (NDT) that utilizes acoustic or sound waves.

3.3.2 Aerial Device. An aerial ladder, elevating platform, or water tower that is designed to position personnel, handle materials, provide continuous egress, or discharge water.

3.3.3 Aerial Ladder. A self-supporting, turntable-mounted, power-operated ladder of two or more sections permanently attached to a self-propelled automotive fire apparatus and designed to provide a
continuous egress route from an elevated position to the ground.  [1901:1.7]  

3.3.4 Aerial Ladder Sections. The structural members of the aerial ladder consisting of the base and fly sections.  

3.3.5 Ambient Temperature. The temperature of the surrounding medium; usually used to refer to the temperature of the air in which a structure is situated or a device operates.  [54:1.7]  

3.3.6 American Society for Nondestructive Testing (ASNT). A professional organization that is devoted to promoting knowledge of nondestructive testing.  

3.3.7 American Welding Society (AWS). An association that provides codes, guidelines, and standards utilized to evaluate welded structures and components in welded structures.  

3.3.8 Ancillary Boom Ladder. A ladder or ladders affixed to a telescoping or articulating boom section.  

3.3.9 Articulating Boom. An aerial device consisting of two or more folding boom sections whose extension and retraction modes are accomplished by adjusting the angle of the knuckle joints.  [1901:1.7]  

3.3.10 Auxiliary Hydraulic Power. A small gasoline engine, diesel engine, or electric motor-driven hydraulic pump used to operate an aerial device in an emergency or in lieu of the main hydraulic system.  [1901:1.7]  

3.3.11 Base Rail. The lower chord (rail) of an aerial ladder to which rungs and reinforcements are attached.  [1901:1.7]  

3.3.12 Base Section. The first or bottom section of an aerial device.  [1901:1.7]  

3.3.13 Boom. An assembled section of an aerial device. The boom construction can be of the stressed skin box beam type, the trussed-lattice-type, or the open “U” truss-type design.  [1901:1.7]  

3.3.14 Boom Boost Cylinders. The hydraulic cylinders located on the upper boom of an articulating boom aerial device that help lift the upper boom from the lower boom.  

3.3.15 Boom Support. A structural component that is attached to the chassis frame and that is used to support the aerial device when it is in the cradled position.  

3.3.16 Bow. The distance that the end of an aerial ladder or boom deviates from a straight line extension of the base section.  

3.3.17 Cable. A wire rope used to transmit forces from one component to another for the purpose of extending or retracting an aerial device.  [1901:1.7]  

3.3.18 Cable Separation Guide. The mechanism that aligns and separates the cable when it is wound on the drum of an aerial ladder’s extension winch.  

3.3.19 Chassis. The basic operating motor vehicle including the engine, frame, and other essential structural and mechanical parts, but exclusive of the body and all appurtenances for the accommodation of driver, property, or passengers, appliances, or equipment related to other than control. Common usage might, but need not, include a cab (or cowl).  [1901:1.7]  

3.3.20 Collector Rings. An assembly of slip rings for transferring electrical energy from a stationary to a rotating member.  [76:675.2]  

3.3.21 Cylinder Links. The mechanisms that can be used in connecting an articulating boom to the end of the upper elevating cylinders or to the lower and upper booms.  

3.3.22 Defect. A discontinuity in a part or a failure to function that interferes with the service or reliability for which the part was intended.  [1901:1.7]  

3.3.23 Deflection. The deviation from a straight course or fixed direction.  

3.3.24 Discontinuity. A change in the normal, physical structure of a material that can affect its serviceability.  

3.3.25 Diverter Valve. A valve that, when actuated, diverts hydraulic fluid from one function to another or from one hydraulic system to another; in aerial devices, it is one valve that diverts hydraulic fluid from the stabilizers when the aerial device is in use and vice versa.  

3.3.26 Drift. A time-dependent movement away from an established position.  

3.3.27 Drip. A flow of liquid that lacks sufficient quantity or pressure to form a continuous stream.  

3.3.28 Elevating Platform. A self-supporting, turntable-mounted device consisting of a personnel-carrying platform attached to the uppermost boom of a series of power-operated booms that articulate, telescope, or both; and that are sometimes arranged to provide the continuous egress capabilities of an aerial ladder.  

3.3.29 Elevation Cylinder. The hydraulic components consisting of a cylinder barrel, cylinder rod, and related hardware that are used to vary the angle of the ladder or booms.  

3.3.30 Elevation Indicator. An instrument on an aerial device that shows the angle of elevation of the aerial ladder or boom.  

3.3.31 Elevation Lock. A manual- or positive-locking device (i.e., holding valve) that can be actuated to maintain indefinitely a desired angle or elevation without dependence upon engine power.  

3.3.32 Emergency Hand-Crank Control. An auxiliary or supplemental control with which the operator can manually operate select functions of the aerial device.  

3.3.33 Extension Cylinder. The hydraulic components consisting of a cylinder barrel, cylinder rod, and related hardware that are used to vary the length of extension of a telescoping aerial device.  

3.3.34 Extension Indicator. A device on an aerial ladder or extendible boom aerial device that indicates the number of feet that the device has been extended.  

3.3.35 Extension Sheave. A pulley through which an extension cable operates.  

3.3.36 Fastener. A mechanical device, such as a rivet, bolt, screw, or pin, that is used to hold two or more components together securely.  

3.3.37 Ferromagnetic Materials. Materials that can be magnetized and strongly attracted to a magnetic field such as iron, steel, cobalt, and nickel.  

3.3.38 Fly Locks. See Ladder Locks.  

3.3.39 Fly Section. Any section of an aerial telescoping device beyond the base section.  [1901:1.7]  

3.3.40 Fracture. A type of defect found in welds that has a large length-to-width ratio and travels through or adjacent to the metal grain boundaries; usually, this type of defect is referred to as a crack.  

3.3.41 Hinge Pins. Pins that are used at either the swivel or point of articulation of an aerial device.  

3.3.42 Holding Valve. A one-way valve that maintains hydraulic pressure in a cylinder until it is activated to release.  

3.3.43 Inspect. To determine the condition or operation of a component(s) by comparing its physical, mechanical, and/or electrical characteristics with established standards, recommendations, and requirements through examination by sight, sound, or feel.  [1915:1.3]
3.3.44* Instability. A condition of a mobile unit in which the sum of
the moments tending to overturn the unit exceeds the sum of the
moments tending to resist overturning. [1901.1.7]

3.3.45 Interlock. A device or arrangement by means of which
the functioning of one part is controlled by the functioning of another.
[1901.1.7]

3.3.46 Ironing. A term used for the damage caused to the bottom of
a base rail by misalignment or malfunction of the rollers, which
causes wear or indentation of the base rail material.

3.3.47 Knuckle. A point of connection between the upper and lower
booms of an articulating device; the point at which lower and upper
booms are hinged together. [1901.1.7]

3.3.48 Ladder Cradle. A structural component that supports an
aerial ladder when it is bedded.

3.3.49 Ladder Locks. The mechanical locks or paws that prevent
movement of the sections of an aerial device when the power is shut
off or in the event of loss of pressure in hydraulic circuits.

3.3.50 Leak. A continuous stream of liquid escaping from a hose,
pipe, coupling, connection, or other confining structure at any point
where the escape should not occur.

3.3.51 Leveling Linkages. The components and controls for
achieving a level position of the platform.

3.3.52 Liquid Penetrant Inspection. A nondestructive inspection
method used to locate and determine the severity of surface
discontinuities in materials, based on the ability of a liquid to
penetrate into small openings, such as cracks.

3.3.53 Load Limit Indicator. A load indicator or an instruction plate
visible at the operator’s position that shows the recommended safe
load at any condition of an aerial device’s elevation and extension.
[1901.1.7]

3.3.54 Magnetic Particle Inspection. A nondestructive inspection
method used to locate discontinuities in ferromagnetic materials by
magnetizing the material and then applying an iron powder to mark
and interpret the patterns that form.

3.3.55 Mobile Unit. A combination of an aerial device, its vehicle,
and related equipment.

3.3.56 Monitor Nozzle. A water stream nozzle that is mounted on an
aerial device and permanently connected to the waterway.

3.3.57 Nondestructive Testing (NDT). One of several methods used
to inspect a structural component without physically altering or
damaging the materials.

3.3.58 Neutral Position. The position of operating controls when the
controls are not engaged.

3.3.59 Operator. A person qualified to operate an aerial device.

3.3.60 Override. A system or device used to neutralize a given action
or motion. [1901.1.7]

3.3.61 Platform. The support structure, floor, railings, and operator
control station for controlling an aerial device that is attached to the
tip of a boom or aerial ladder for carrying personnel and equipment.

3.3.62 Pneumatic Lines. The lines that supply air, which is normally
for a breathing air system or for pneumatic power tools, to a platform
or to the tip of an aerial ladder.

3.3.63 Properly. In accordance with the manufacturer’s
specifications or as recommended by the manufacturer.

3.3.64 PTO. Power takeoff. [1901.1.7]

3.3.65 Qualified Person. A person who, by possession of a
recognized degree, certificate, professional standing, or skill, and
who, by knowledge, training, and experience, has demonstrated the ability to deal with problems relating to the subject matter, the work,
or the project. [1500.1.5]

3.3.66 Radiography. A nondestructive inspection method that uses X
rays, nuclear radiation, or both to detect discontinuities in material
and to present their images on a recording medium.

3.3.67 Rated Capacity. The total amount of weight of all personnel
and equipment that can be supported at the outermost rung of an
aerial ladder or on the platform of an elevating platform with the
waterway uncharged. [1901.1.7]

3.3.68* Rated Vertical Height. The vertical distance measured by a
plumb line from the maximum elevation of the aerial device allowed
by the manufacturer to the ground. 3.3.69 Relief Valve. A device
that allows the bypass of fluids to limit the pressure in a system.

3.3.70 Rotation Gear. The main gear of an aerial device that is used
for the rotation of the turntable.

3.3.71 Rotation Gear Reduction Box. The mechanism of an aerial
device that transfers hydraulic or electric power to the rotation gear,
creating the torque necessary to rotate the turntable.

3.3.72 Rotation Lock. A strong friction or other positive-locking
device (e.g., holding valve) that retains the turntable in any desired position.

3.3.73 Rung Cap Casting. A casting that can be riveted to the outside of
the base rail over the ends of each rung on an aerial ladder.

3.3.74 Safety Stop Mechanism. A device that is located on the aerial
device and prevents raising the elevating platform booms or sections
beyond safe, operating, horizontal or vertical angles.

3.3.75 Slide Blocks. Blocks made of a variety of materials (e.g., brass,
nylatron) that act as spacing devices, wear strips, or wear pads.

3.3.76 Spirit Level. An indicating device that is affixed to a turntable
or truck body and is used to verify the levelness of a turntable prior to
operating an aerial device.

3.3.77 Stabilizer. A device integral with or separately attached to the
chassis of an aerial fire apparatus that is used to increase the
moments tending to resist overturning the apparatus.

3.3.78 Stabilizer Pad. A plate inserted beneath a stabilizer shoe to
give greater surface bearing area. [1901.1.7]

3.3.79 Stabilizer Shoe. A permanently mounted shoe on a stabilizer
to provide a ground surface area. [1901.1.7]

3.3.80 Stressed-Skin-Type Boom Section. A boom framework that is
fabricated by the welding of metal into full box sections with internal
torsional members.

3.3.81 Telescopic. Extended or retracted by sliding of the
overlapping sections.

3.3.82 Test. To verify serviceability by measuring the mechanical,
 pneumatic, hydraulic, or electrical characteristics of an item and
comparing those characteristics with prescribed standards.

3.3.83 Top Rail. The top chord (rail) of an aerial ladder to which
reinforcements are attached. [1901.1.7]

3.3.84* Torque Box. A structural component placed between the
turntable and the chassis of an aerial device to absorb the stresses of
operation.

3.3.85 Torque Value. A measure of tightness or the amount of stress
that is put on a fastening device (i.e., bolt) to secure it properly.

3.3.86 Trussed-Lattice-Type Boom Section. An open truss boom
framework with vertical and diagonal braces that are fastened to
horizontal beams of the frame.
3.3.87 * Turntable. A structural component that connects the aerial device to the chassis and stabilization system through a rotating bearing that permits 360-degree continuous rotation of the aerial device.

3.3.88 Turntable Alignment Indicator. An indicator that facilitates alignment of the aerial device with the boom support for bedding purposes.

3.3.89 Twist. The degree of rotational movement from a given position.

3.3.90 Ultrasonic Inspection. A nondestructive method of inspection in which high-frequency vibrations are injected through the surface of the test material and bounced back to their source from the opposite surface; if a flaw exists, signals return in a different pattern, revealing the location and extent of the flaw.

3.3.91 Visual Inspection. Inspection by the eye without recourse to any optical devices, except prescription eyeglasses.

3.3.92 Water Tower. An aerial device consisting of permanently mounted power-operated booms and a waterway designed to supply a large capacity mobile elevated water stream. The booms can be of articulating design or telescoping design. [1901:1.7]

3.3.93 Weldment. A structure that is formed by the welding together of several components.

Chapter 4 Inspection and Test Procedures

4.1 General.

4.1.1 The inspections, operational tests, and load tests specified in this standard shall be conducted at the following times:

(1) At least annually

(2) After major repairs or overhaul

(3) Following the use of the aerial device when the aerial device could have been subjected to unusual operating conditions of stress or load

(4) When there is reason to believe that usage has exceeded the manufacturer’s recommended aerial device operating procedures

4.1.2* The complete inspections and tests, including the nondestructive testing (NDT) defined in this standard, shall be done at least every 5 years.

4.1.3 Nondestructive testing shall be conducted whenever visual inspection or load testing indicates a potential problem or when there is a desire to further confirm continued operational safety.

4.1.4 If the aerial device is involved in a situation that produces any structural damage, or if the inspections and tests that are required in this standard reveal any problems that affect the structural integrity of the aerial device, the aerial device shall be placed out of service.

4.1.4.1* The aerial device shall be repaired to an acceptance level in accordance with the manufacturer’s standard.

4.1.4.2 If the manufacturer is no longer in business and, therefore, cannot be consulted with regard to repair of the aerial device, the repairs shall be performed by a repair facility that is acceptable to the authority having jurisdiction.

4.1.4.3 The aerial device shall be tested to the full operational load and NDT of this standard before it is placed back in service.

4.1.5* The inspections and tests specified herein shall be the minimum service test requirements for all aerial devices.

4.1.5.1 Since each manufacturer’s unit will be somewhat different, specific attention shall be given to the manufacturer’s instructions concerning periodic maintenance and inspection checks.

4.1.5.2 The testing personnel shall have written documentation identifying the aerial device manufacturer’s operating procedures, component performance specifications, and tolerances.

4.1.6* Only qualified persons, acceptable to the authority having jurisdiction, shall be allowed to operate the apparatus during testing procedures.

4.2 Inspection Personnel.

4.2.1 The inspections and tests outlined in this standard shall be performed by qualified persons, a third-party testing company, or the manufacturer as determined acceptable by the authority having jurisdiction.

4.2.2 The person actually performing the nondestructive test work shall be certified as at least a Level II NDT technician in the test method used, as specified in ASNT CP-189, Standard for Qualification and Certification of Nondestructive Testing Personnel.

4.2.3 Trainees and personnel certified to Level I in the test method used shall be permitted to conduct the nondestructive tests so long as they work under the direct and immediate supervision of either a Level II or an ASNT Level III technician holding current certification in the same test method.

4.3 Third-Party Test Companies. If a third-party test company is employed to do NDT, that company shall comply with ASTM E 545, Standard Practice for Agencies Performing Nondestructive Testing.

4.4 Visual Inspection. A visual inspection shall be performed in accordance with the requirements of Chapters 5, 6, or 7, depending on the aerial device.

4.4.1 The visual inspection shall be conducted prior to any operational or load testing, and shall be carried out in a systematic sequence with proper attention to detail.

4.4.2 This visual inspection shall be for the detection of any visible defects, damage, or improperly secured parts.

4.5 Weld Inspection.

4.5.1 When the inspections as required by 4.1.1 are performed, all accessible structural welds shall be visually inspected for fractures.

4.5.2 When the nondestructive testing as required by 4.1.2 and 4.1.3 is performed, all accessible structural welds shall be inspected by technicians that meet the criteria of Section 4.2 for the test methods used.

4.5.3 Welds on Steel.

4.5.3.1 All accessible structural welds on steel shall be inspected in accordance with the applicable provisions of AWS D1.1, Structural Welding Code—Steel.

4.5.3.2 All structural welds shall comply with the weld quality as defined in the visual inspection acceptance criteria of AWS D1.1.

4.5.4 Welds on Aluminum.

4.5.4.1 All accessible structural welds on aluminum shall be inspected in accordance with the applicable provisions of AWS D1.2, Structural Welding Code—Aluminum.

4.5.4.2 All structural welds shall comply with the weld quality as defined in the visual inspection acceptance criteria of AWS D1.2.
4.5.5 The application of a particular nondestructive weld inspection technique shall be as recommended by AWS B1.10, Guide for the Nondestructive Inspection of Welds.

4.6 Bolt and Pin Inspection. Bolts and pins that are subjected to ultrasonic testing shall contain no ultrasonic CRT indications that can be interpreted as cracks or elongated material.

4.7 Nondestructive Testing Procedures.

4.7.1 All test procedures shall be consistent with ASTM E 1316, Standard Terminology for Nondestructive Examinations.

4.7.2 All ultrasonic inspections shall be conducted in accordance with the following standards:
   (1) ASTM E 114, Standard Practice for Ultrasonic Pulse-Echo Straight-Beam Examination by the Contact Method
   (2) ASTM E 979, Standard Practice for Measuring Thickness by Manual Ultrasonic Pulse-Echo Contact Method

4.7.3 All magnetic particle inspections shall be conducted in accordance with ASTM E 709, Standard Guide for Magnetic Particle Examination.

4.7.4 All liquid penetrant inspections shall be conducted in accordance with ASTM E 165, Standard Test Method for Liquid Penetrant Examination.

4.7.5 All radiographic inspection shall be conducted in accordance with ASTM E 1032, Standard Test Method for Radiographic Examination of Weldments.

4.7.6 All hardness readings shall be conducted in accordance with the following standards:
   (1) ASTM B 647, Standard Test Method for Indentation Hardness of Aluminum Alloys by Means of a Webster Hardness Gauge
   (2) ASTM B 648, Standard Test Method for Indentation Hardness of Aluminum Alloys by Means of a Barcol Impresor
   (3) ASTM E 6, Standard Terminology Relating to Methods of Mechanical Testing
   (4) ASTM E 10, Standard Test Method for Brinell Hardness of Metallic Materials
   (5) ASTM E 18, Standard Test Methods for Rockwell Hardness and Rockwell Superficial Hardness of Metallic Materials

4.7.7 All acoustic emission inspections shall be conducted in accordance with ASTM E 509, Standard Practice for Acoustic Emission Monitoring of Structures During Controlled Stimulation.

Chapter 5 Inspecting and Testing Aerial Ladders

5.1 General.

5.1.1 The tests specified in this chapter shall apply only to metal aerial ladders.

5.1.2 In addition to the manufacturer’s recommendations for annual inspections and tests, the inspections and tests detailed in Sections 5.2 through 5.11 shall be performed.

5.1.3 An inspection preceded by a plus sign (+) indicates that an appropriate nondestructive test (NDT) shall be conducted as required by 4.1.2 and 4.1.3.

5.2 Service Records. The aerial ladder’s service records shall be checked for any reports that indicate defective conditions.

5.3 Hydraulic Components. Hydraulic components shall show no signs of hydraulic fluid leakage.

5.3.1 A component shall be considered leaking if hydraulic fluid (oil) droplets are forming on the component.

5.3.2 A film of hydraulic fluid on the component shall not be considered severe enough to categorize the component as leaking.

5.4 Turntable, Torque Box, Suspension, and Tractor-Drawn Components Inspection and Test. The turntable, torque box, suspension components and tractor-drawn components, where applicable, shall be inspected on all aerial ladders in accordance with 5.4.1 through 5.4.29.

5.4.1 Rotation-Bearing Mounting Bolts. The rotation-bearing mounting bolts shall be inspected as follows:
   (1) Inspect all accessible bolts for proper grade and installation as specified by the apparatus manufacturer.
   (2) Using a properly calibrated torque wrench, verify that the bolt torque on all accessible bolts meets the apparatus manufacturer’s specifications.
   (3) (+) Inspect all accessible bolts for internal flaws.

5.4.2 Torque Box Mounting to Frame.

5.4.2.1 If the torque box is bolted to the frame, the torque box mounting to the frame shall be inspected as follows:
   (1) Inspect all accessible bolts for proper grade and installation as specified by the apparatus manufacturer.
   (2) Using a properly calibrated torque wrench, verify that the bolt torque on all accessible bolts meets the apparatus manufacturer’s specifications.
   (3) (+) Inspect all bolts for internal flaws.

5.4.2.2 If the torque box is welded to the frame, the torque box mounting to the frame shall be inspected as follows:
   (1) Visually inspect all accessible attaching welds for fractures.
   (2) (+) Inspect all accessible attaching welds.

5.4.3 Tractor-Drawn Components Mounting to Frame.

5.4.3.1 If tractor-drawn components are bolted to the frame, the mounting of the tractor-drawn components to the frame shall be inspected as follows:
   (1) Inspect all accessible bolts for proper grade and installation as specified by the apparatus manufacturer.
   (2) Using a properly calibrated torque wrench, verify that the torque on all accessible bolts meets the apparatus manufacturer’s specifications.
   (3) (+) Inspect all bolts for internal flaws.

5.4.3.2 If tractor-drawn components are welded to the frame, the mounting of the tractor-drawn components to the frame shall be inspected as follows:
   (1) Visually inspect all accessible attaching welds for fractures.
   (2) (+) Inspect all accessible attaching welds.

5.4.4 Suspension System.

5.4.4.1 If the suspension system components are bolted to the frame, the mounting of the suspension system components to the frame shall be inspected as follows:
5.4.10 Elevation, Extension, and Rotation Lock(s). The elevation, extension, and rotation lock(s) shall be inspected as follows:

(1) Inspect the manual valve elevation, extension, and rotation lock(s) for external hydraulic fluid leakage.

(2) Verify by visual inspection that the manual valve elevation lock operates properly by engaging the lock and then attempting to raise and lower the ladder while the main hydraulic system is operating.

(3) Verify by visual inspection that the manual valve extension lock operates properly by engaging the lock and then attempting to extend or retract the ladder while the main hydraulic system is operating.

(4) Verify by visual inspection that the manual valve rotation lock operates properly by engaging the lock and attempting to rotate the turntable clockwise and counterclockwise while the main hydraulic system is operating.

5.4.11 Power Takeoff. The power takeoff shall be inspected as follows:

(1) Inspect the power takeoff for external hydraulic fluid leakage.

(2) Verify that the power takeoff engages and disengages properly.

5.4.12 Hydraulic Pump. The hydraulic pump shall be inspected for external hydraulic fluid leakage.

5.4.13 Collector Rings. The collector rings shall be inspected as follows:

(1) If the collector rings are accessible, inspect them for foreign material buildup.

(2) If the collector ring terminals are accessible, inspect them for damage.

(3) Conduct tests to ensure the proper operation of the collector rings by rotating the aerial device while electric-powered devices are in operation.

(4) If applicable, check for indications of moisture in the electrical chamber by visually inspecting the desiccant moisture indicators.

5.4.14 Elevation Cylinder Anchor Ears and Plates.

5.4.14.1 The elevation cylinder anchor ears and plates shall be inspected as follows:

(1) Visually inspect the elevation cylinder anchor ears and plates for defects and all of the welds for fractures.

(2) (+) Inspect all reduction box attaching welds.

5.4.14.2 If the elevation cylinder anchor is bolted, it shall be further inspected as follows:

(1) Inspect all accessible bolts for proper grade and installation as specified by the apparatus manufacturer.

(2) Using a calibrated torque wrench, verify that the torque on all bolts meets the apparatus manufacturer’s specifications.

(3) (+) Inspect all accessible attaching welds.

5.4.15 Elevation Cylinder Pins. The elevation cylinder pins shall be inspected as follows:

(1) If the elevator cylinder anchor is bolted, it shall be further inspected as follows:

(1) Inspect all accessible bolts for proper grade and installation as specified by the apparatus manufacturer.

(2) Using a properly calibrated torque wrench, verify that the bolt torque on all accessible bolts meets the manufacturer’s specification.

(3) (+) Inspect all accessible bolts for internal flaws.

5.4.16 Elevation Cylinders.

5.4.16.1 The elevation cylinders shall be inspected as follows:

(1) Inspect the cylinder rods for pitting, scoring, and other defects.

(2) Inspect the cylinder rod-o-barrel seal and the end gland seal for external hydraulic fluid leakage that exceeds the manufacturer’s specifications.

5.4.16.2* The elevation cylinders shall be subjected to a drift test as follows:

(1) With the hydraulic fluid at ambient temperature, place the aerial device at 60-degrees elevation at full extension.

(2) Mark the cylinder position.
(3) Close the manually operated locking valves, and allow the device to stand for 1 hour with the engine off.

(4) Measure the drift and verify that the results do not exceed the manufacturer’s specifications for allowable cylinder drift.

5.4.17 Holding Valves on Elevation Cylinders. The holding valves on the elevation cylinders shall be inspected for external hydraulic fluid leakage.

5.4.18 Operating Controls. The operating controls shall be inspected as follows:

(1) Inspect the operating controls to ensure control handles are not damaged or missing, functions are identified, operating instructions and warnings are posted, and there is no hydraulic fluid leakage.

(2) Verify that the controls operate smoothly, return to neutral position when released, and do not bind during operation.

(3) If interlocks have been provided or are required to prevent unintentional operation of the aerial device, verify that the interlocks or locking devices are operating properly.

5.4.19 Load Limit Indicators. The load limit indicators shall be inspected for proper operation and legibility.

5.4.20 Emergency Hand-Crank Controls. The emergency hand-crank controls shall be inspected for proper operation.

5.4.21 Auxiliary Hydraulic Power. The auxiliary hydraulic power shall be inspected for proper operation.

5.4.22 Turntable Alignment Indicator. The presence of a turntable alignment indicator shall be verified.

5.4.23 Throttle Control.

5.4.23.1 The throttle control shall be inspected for proper operation.

5.4.23.2 The operating speed of the engine shall be measured using a tachometer or a revolution counter and shall be checked against the manufacturer’s specifications.

5.4.24 Communication System. The communication system shall be inspected for proper installation and operation.

5.4.25 Relief Hydraulic Pressure. The main hydraulic pump relief pressure and compensator pressure shall be tested to determine that they do not exceed the manufacturer’s specifications.

5.4.26 Unit Main Frame. The unit main frame shall be inspected as follows:

(1) Visually inspect the main frame for any cracks, bends, dents, twists, or other weldment defects.

(2) Visually inspect any welds for fractures.

(3) (+) Inspect all main frame welds.

5.4.27 Transmission/Aerial Device Interlocks. If interlocks have been provided that prevent operation of the aerial device until both the parking brakes have been set and the transmission has been positioned properly, the interlocks shall be inspected to verify they are operating properly.

5.4.28 Engine Speed Interlocks. If interlocks have been provided that allow operation of the engine speed control only after both the parking brakes have been set and the transmission has been positioned properly, the interlocks shall be inspected to verify they are operating properly.

5.4.29 Breathing Air Systems. If a breathing air system is provided, the system shall be inspected as follows:

(1) Verify that the breathing air system—including the integrity of the air cylinder mounting, the regulator, and the air lines from the air cylinder(s) to the top of the aerial device—is properly installed.

(2) Verify that all component parts of the system are present and in serviceable condition.

(3) Visually inspect the air cylinder mounting brackets for defects and the welds for fractures.

(4) (+) Inspect all welds on air cylinder mounting brackets.

(5) Check that the air pressure regulator is set at the apparatus manufacturer’s recommended pressure.

5.5 Stabilizer Inspection and Test. The stabilizer components, where applicable, shall be inspected on all aerial ladder apparatus in accordance with 5.5.1 through 5.5.15.

5.5.1 Stabilizer Structural Components. The stabilizer structural components shall be inspected as follows:

(1) Visually inspect all of the stabilizer components for defects and all of the welds for fractures.

(2) (+) Inspect all stabilizer structural component welds.

5.5.2 Stabilizer Pads. The stabilizer pads shall be inspected to verify that they are present, are of proper construction, and are in serviceable condition.

5.5.3 Stabilizer Mounting to Frame or Torque Box.

5.5.3.1 The stabilizer mounting to the frame or torque box attachment shall be visually inspected for defects such as dents and bends.

5.5.3.2 If the stabilizer mounting to the frame or torque box is welded, it shall be further inspected as follows:

(1) Visually inspect the stabilizer to frame or torque box mounting for weld cracks.

(2) (+) Inspect the stabilizer to frame or torque box mounting welds.

5.5.3.3 If the stabilizer mounting to the frame or torque box is bolted, it shall be further inspected as follows:

(1) Inspect all bolts for proper fastener grade and installation as specified by the apparatus manufacturer.

(2) Using a properly calibrated torque wrench, verify that the torque on all bolts meets the apparatus manufacturer’s specifications.

(3) (+) Inspect all bolts for internal flaws.

5.5.4 Hydraulic Lines and Hose in Stabilizer System. The hydraulic lines and hoses in the stabilizer shall be inspected for kinks, cuts and abrasions, and leakage at connectors and fittings.

5.5.5 Stabilizer Interlock System. The stabilizer interlock system shall be inspected to verify that it is operating properly.

5.5.6 Stabilizer Warning Device. The stabilizer warning device shall be inspected to verify that it is operating properly.

5.5.7 Stabilizer Extension Cylinder Pins and Hinge Pins. The stabilizer extension cylinder pins and hinge pins shall be inspected as follows:

(1) Inspect all stabilizer cylinder pins and hinge pins for proper installation, lubrication, operation, and retention.

(2) (+) Inspect all stabilizer pins and hinge pins for internal flaws.

5.5.8 Stabilizer Extension Cylinders.

5.5.8.1 The stabilizer extension cylinders shall be inspected as follows:
(1) Inspect the stabilizer extension cylinder rods for pitting, scoring, and other defects.

(2) Inspect the cylinder rod-to-barrel seals and the end gland seals for external hydraulic fluid leakage that exceeds the manufacturer’s specifications.

5.5.8.2 The stabilizer extension cylinder shall be subjected to a drift test as follows:
(1) With the hydraulic fluid at ambient temperature, properly set the stabilizer’s cylinders.
(2) Mark the cylinder position.
(3) Measure the drift after 1 hour with the engine off.
(4) Verify that the results do not exceed the manufacturer’s specification for allowable stabilizer cylinder drift.

5.5.9 Holding Valves on Extension Cylinders. The holding valves on extension cylinders shall be inspected for external leakage of hydraulic fluid.

5.5.10 Operating Controls. The operating controls shall be inspected as follows:
(1) Inspect the operating controls to ensure control handles are not damaged or missing, functions are identified, operating instructions and warnings are posted, and there is no hydraulic fluid leakage.
(2) Verify that the controls operate smoothly, return to the neutral when released, and do not bind during operation.
(3) If interlocks have been provided or are required to prevent unintentional operation of the aerial device, verify that the interlocks or locking devices are operating properly.

5.5.11 Diverter Valve. The diverter valve shall be inspected for external hydraulic fluid leakage.

5.5.12 Positive Stops. The mechanical stabilizers shall be inspected for proper operation of the positive stops that prevent overextension.

5.5.13 Stabilizer Deployment. If the stabilizer system is operated hydraulically, the system shall be inspected to verify that it can be deployed within the time frame designated by the aerial device manufacturer.

5.5.14 Manual Spring Locks. The stabilizer manual spring locks shall be inspected for proper condition and operation.

5.5.15 Tractor Spring Lockout Device. If the aerial ladder is tractor driven, the spring lockout device shall be inspected for any discontinuities and for proper operation.

5.6 Aerial Ladder Inspection and Test. The aerial ladder shall be inspected in accordance with 5.6.1 through 5.6.30.

5.6.1 Structural Modifications, Improper Repairs, or Added Weight.

5.6.1.1 The aerial ladder shall be inspected for structural modifications or improper repairs.

5.6.1.2 The aerial ladder shall be inspected to determine that no extra equipment has been added to the aerial ladder without subtracting the weight of such equipment from the rated capacity.

5.6.1.3 Details of any structural modifications, improper repairs or added weight shall be contained in the required report.

5.6.2 Aerial Ladder Weldments. All aerial ladder weldments shall be inspected as follows:
(1) Visually inspect all of the accessible aerial ladder weldments for defects and all of the welds for fractures.
(2) (+) Inspect all accessible welds on the ladder.

5.6.3 Aerial Ladder Fasteners. All aerial ladder structural fasteners and fastened connections shall be inspected visually for cracked fasteners and material cracks around the fasteners.

5.6.4 Ladder Section Alignment. Measurements shall be taken to determine that the amount of ladder section twist or bow in the aerial ladder does not exceed manufacturer’s specifications for allowable ladder section twist or bow.

5.6.5 Hydraulic, Pneumatic, and Electrical Lines in Ladder Sections. All hydraulic, pneumatic, and electrical lines in ladder sections shall be inspected for proper mounting, and for wear, cracking, kinks, and abrasions.

5.6.6 Top Rails. The top rails shall be inspected as follows:
(1) Inspect the top rails for straightness or any signs of misalignment.
(2) (+) Take hardness readings at intervals of 28 in. (710 mm) or less along the entire length of both top rails of aluminum ladders, and compare the results with the manufacturer’s specifications for the hardness of the material used for construction of the top rail.

5.6.7 Vertical and Diagonal Braces. The vertical and diagonal braces shall be inspected as follows:
(1) Inspect the verticals and diagonals for straightness, dents, and other deformities.
(2) (+) Inspect all accessible attachment welds.

5.6.8 Base Rails. The base rails shall be inspected as follows:
(1) Inspect the base rail for straightness and any signs of wear, ironing, dents, or corrosion.
(2) (+) Inspect the bottom of all hollow I-beam base rails to determine that the thickness of the rail is not less than the manufacturer’s minimum specifications.
(3) (+) Take hardness readings at intervals of 28 in. (710 mm) or less along the entire length of both base rails of aluminum ladders, and compare the results with the manufacturer’s specifications for the hardness of the material used for construction of the base rail.

5.6.9 Rungs. All rungs of the aerial ladder shall be inspected for straightness, signs of fly lock damage, damaged or loose rung covers and rung cap castings, and signs of cracks or missing rivets, if applicable.

5.6.10 Folding Steps. The folding steps on the ladder shall be inspected as follows:
(1) Visually inspect the folding steps and folding step mounting brackets for defects and the welds for fractures.
(2) (+) Inspect all welds on the folding step(s) and folding step mounting brackets.

5.6.11 Rollers. All rollers shall be inspected for proper lubrication and operation, and for any signs of wear.

5.6.12 Guides, Babbitts, Wear Strips, Pads, and Slide Blocks.

5.6.12.1 The guides shall be visually inspected for cracked welds, loose rivets, alignment problems, and any irregularities.

5.6.12.2 The babbitts shall be inspected for signs of wear.

5.6.12.3 The wear strips, pads, and slide blocks shall be inspected for wear and gouging, and for proper mounting.

5.6.13 Extension Sheaves. The extension sheaves shall be inspected as follows:
(1) Inspect extension sheaves for signs of wear, free movement during operation, proper retainers, and proper lubrication.
5.6.14 Extensions Cables. The extension cables shall be inspected for compliance with Appendix A of SAE J959, Lifting Crane, Wire-Rope Strength Factors.

5.6.15 Extension and Retraction Motor. The extension and retraction motor shall be inspected for signs of external hydraulic fluid leakage and, where applicable, brake wear and brake alignment with the shaft.

5.6.16 Cable Separation Guide. During operation of the aerial ladder, the cable separation guide shall be inspected visually for free travel and any signs of misalignment.

5.6.17 Winch Holding Capacity. The winch shall be inspected for holding capacity as follows:

1. Fully elevate the aerial ladder and extend it 10 ft (3 m).
2. Measure the winch slippage for a 5-minute period.
3. Verify that the slippage does not exceed the manufacturer’s specifications.

5.6.18 Brake Holding Capacity. The brake holding capacity of the extension motor shall be inspected as follows:

1. Fully elevate the aerial ladder and extend it 10 ft (3 m).
2. Measure the brake slippage for a 5-minute period.
3. Verify that the slippage does not exceed the manufacturer’s specifications.

5.6.19 Extension, Elevation, and Rung Alignment Indicators. The extension, elevation, and rung alignment indicators shall be inspected for legibility, clarity, and accuracy.

5.6.20 Fly Locks. The fly lock mechanisms shall be inspected for proper mounting, alignment, lubrication, and operation.

5.6.21 Ladder Cradle.

5.6.21.1 The aerial ladder cradle shall be inspected as follows:

1. Inspect the ladder cradle for wear, proper alignment, and the cradle pad for damage.
2. Visually inspect the ladder cradle for defects such as weld cracks, dents, or bends.
3. (+) Inspect the ladder cradle welds and bracket attachments.

5.6.21.2 If the aerial ladder cradle is bolted, it shall be further inspected as follows:

1. Inspect all accessible bolts for proper grade and installation as specified by the apparatus manufacturer.
2. Using a properly calibrated torque wrench, verify that the bolt torque on all accessible bolts meets the manufacturer’s specification.
3. (+) Inspect all accessible bolts for internal flaws.

5.6.22 Ladder Bed Lock. The ladder bed lock mechanism and hydraulic lines shall be inspected for proper mounting, signs of wear, and hydraulic fluid leakage at fittings.

5.6.23 Stop Mechanism. The stop mechanisms shall be inspected to ensure that they prevent overextension or overretraction of the aerial ladder.

5.6.24 Maximum Extension Warning Device. During operation, if the aerial ladder is equipped with an audible device that warns of the approach of maximum extension, the device shall be inspected to verify proper operation.

5.6.25 Ladder Illumination. The lights that are used to illuminate the ladder shall be inspected for proper operation.

5.6.26 Extension Cylinder Anchor Ears and Plates.

5.6.26.1 The extension cylinder anchor ears and plates shall be inspected as follows:

1. Inspect all accessible bolts for proper grade and installation as specified by the apparatus manufacturer.
2. Using a properly calibrated torque wrench, verify that the bolt torque on all accessible bolts meets the manufacturer’s specification.
3. (+) Inspect all accessible bolts for internal flaws.

5.6.27 Extension Cylinder Pins. The extension cylinder pins shall be inspected as follows:

1. Inspect the cylinder pins for proper installation and retention.
2. (+) Inspect the cylinder pins for internal flaws.

5.6.28 Extension Cylinder.

5.6.28.1 The extension cylinders shall be inspected as follows:

1. Inspect the cylinder rods for pitting, scoring, and other defects.
2. Inspect the cylinder rod-to-barrel seal and the end gland seal for external hydraulic fluid leakage that exceeds the manufacturer’s specifications.

5.6.28.2 The extension cylinder shall be subjected to a drift test as follows:

1. With the hydraulic fluid at ambient temperature, place the aerial device at full elevation and 10 ft (3 m) of extension.
2. Mark the cylinder position or the second aerial ladder section in relation to the base section.
3. Allow the ladder to stand for 1 hour with the engine off.
4. Measure the drift and verify that the results do not exceed the manufacturer’s specifications for allowable cylinder drift.

5.6.29 Holding Valves on Extension Cylinder. The holding valves shall be inspected for external and internal hydraulic fluid leakage.

5.6.30 Tip Controls. If the aerial ladder is equipped with a secondary operating position at the tip, the controls shall be inspected as follows:

1. Inspect the operating to ensure control handles are not damaged or missing, functions are identified, and operating instructions and warnings are posted.
2. Verify that the controls operate smoothly, return to neutral when released, and do not bind during operation.
3. Verify that the turntable or lower controls will override the tip controls.
4. Verify that any safety devices that are designed to operate in conjunction with the tip controls are fully operational.
5.8 Load Testing.

5.8.1* Tests shall be conducted when the wind velocity is less than 10 mph (16 kmph).

5.8.2 Only those personnel who are essential to conduct the test shall be permitted near the apparatus during the test.

5.8.3 A close watch shall be maintained during all load tests for any signs of instability, the development of conditions that could cause damage or permanent deformation, or twist that exceeds the aerial ladder manufacturer’s allowance. The test shall be discontinued immediately if such conditions develop.

5.8.4 Horizontal Load Test.

5.8.4.1 The aerial apparatus shall be on a hard, level surface with the stabilizers deployed in accordance with the manufacturer’s instructions. The aerial ladder’s turntable shall be level.

5.8.4.2* A test cable hanger shall be attached to the top rung of the top section of the ladder and properly centered.

5.8.4.3 The maximum rated capacity that the ladder is designed to support in the horizontal position at full extension shall be determined from the manufacturer’s load chart or operator’s manual. If full extension is not permitted in the horizontal position with a specified rated capacity, then the maximum permissible extension with a specified rated capacity shall be used for the purpose of this test.

5.8.4.4 The ladder shall be positioned as follows.

(a) For single chassis apparatus, the ladder shall be rotated, if necessary, until it is positioned over the rear and parallel to the vehicle centerline. 

(b) For a tractor-drawn apparatus, the ladder shall be positioned in the most stable position as recommended by the manufacturer.

5.8.4.5 The ladder shall be placed in the horizontal position and extended to full extension or the maximum-permitted extension as determined in 5.8.4.3. The base section shall not be allowed to rest in the bed. 

5.8.4.6 The ladder section locks, either manual pawls or hydraulic holding valves, shall be applied properly.

5.8.4.7 The elevation cylinders’ integral holding valve or shutoff safety valve shall be properly closed or applied.

5.8.4.8* A free-hanging weight that is equal to the rated capacity, as determined in 5.8.4.3, shall be applied gradually to the top rung of the aerial ladder by utilizing a test weight container or other suitable means of applying the weight.

CAUTION: Dropping the weights and shock loading the ladder can damage the ladder and shall not be permitted.

5.8.4.8.1 The weight shall be suspended by a cable and shall not be more than 3 ft (1 m) above the ground.

5.8.4.8.2 The combined weight of the test cable hanger and cable, the test weight container, and the test weights shall not exceed the rated capacity.

5.8.4.9 The test weight shall be sustained by the unsupported aerial ladder for 5 minutes.

5.8.4.10 The test weight shall hang freely from the tip of the aerial ladder. If the test weight hanger and ladder deflection are such that the test weight comes to rest on the ground, it shall be permissible to raise the ladder elevation slightly above the horizontal position. 

CAUTION: At no time during the load test shall the ladder be moved with the test weight applied.

5.8.4.11 After removal of the test weight, a complete visual inspection shall be made of all load-supporting elements.

5.8.4.11.1 Any visually detectable signs of damage, permanent deformation, or twist exceeding the manufacturer’s specification shall constitute noncompliance with the load test requirements, and the aerial ladder shall be placed out of service.

5.8.4.11.2 The aerial device shall also meet the requirements of Section 5.7 after the horizontal load test.

5.8.5 Maximum Elevation Load Test.

5.8.5.1 The aerial apparatus shall be on a hard, level surface with the stabilizers deployed in accordance with the manufacturer’s instructions, and the aerial ladder’s turntable shall be level.

5.8.5.2* A test cable hanger shall be attached to the top rung of the top section of the ladder and centered.

5.8.5.3 The maximum rated capacity that the ladder is designed to support in the maximum-elevated position at full extension shall be determined from the manufacturer’s load chart or operator’s manuals.

5.8.5.4 The ladder shall be rotated, if necessary, until the ladder is positioned over the rear and parallel to the vehicle centerline. Midship-mounted aerial ladders shall be permitted to be rotated slightly off of the vehicle centerline to apply the test load without interfering with the body of the apparatus.

5.8.5.5 The ladder shall be elevated to maximum elevation and fully extended.

5.8.5.6 The ladder section locks, either manual pawls or hydraulic holding valves, shall be applied properly.

5.8.5.7 The elevation cylinders’ integral holding valve or shutoff safety valve shall be properly closed or applied.

5.8.5.8 A free-hanging weight that is equal to the rated capacity, as determined in 5.8.5.3, shall be applied gradually to the top rung of the aerial ladder by utilizing a test weight container or other suitable means of applying the weight.

CAUTION: Dropping the weights and shock loading the ladder can damage the ladder and shall not be permitted.
5.8.5.8.1 The weight shall be suspended by a cable and shall not be more than 3 ft (1 m) above the ground.

5.8.5.8.2 The combined weight of the test cable hanger and cable, the test weight container, and the test weights shall not exceed the rated capacity.

5.8.5.9 The test weight shall be sustained by the unsupported aerial ladder for 5 minutes.

5.8.5.10 The test weight shall hang freely from the tip of the aerial ladder.

CAUTION: At no time during the load test shall the ladder be moved with the test weight applied.

5.8.5.11 After removal of the test weight, a complete visual inspection shall be made of all load-supporting elements.

5.8.5.11.1 Any visually detectable signs of damage, permanent deformation, or twist exceeding the manufacturer’s specification shall constitute noncompliance with the load test requirements, and the aerial ladder shall be placed out of service.

5.8.5.11.2 The aerial device shall also meet the requirements of Section 5.7 after the maximum elevation load test.

5.9 Waterway System Test.

5.9.1 The following inspection and test shall apply only to permanently piped, aerial ladder waterway systems.

5.9.2 The waterway system shall be inspected as follows:

(1) Inspect the system for proper operation of all components.

(2) Inspect the system for rust, corrosion, blockage, or other defects.

5.9.3 The waterway-attaching brackets shall be inspected as follows:

(1) Inspect the brackets for loose bolts, weld fractures, or other defects.

(2) (+) Inspect all attaching welds.

5.9.4 Pressure Test. The water system shall be pressure tested.

5.9.4.1* The aerial device shall be positioned between 0 degrees and 10 degrees elevation and fully retracted.

5.9.4.1.1 If there is not a valve at the discharge end, a valve shall be attached for the purpose of this test.

5.9.4.1.2* The water system shall be filled with water, and the valve at the discharge end shall be closed.

CAUTION: For safety reasons, all air must be removed from the system.

5.9.4.1.3 The pressure on the system shall be raised to the water system manufacturer’s maximum-rated working pressure and shall be maintained while the operations and inspections required by 5.9.4.1.4 and 5.9.4.1.5 are conducted.

5.9.4.1.4 The aerial device shall be raised to full elevation and rotated 360 degrees.

5.9.4.1.5 The water system, including the turntable swivel, shall be checked for leaks.

5.9.4.1.6 Care shall be taken not to overheat the water pump during this test.

5.9.4.2* The aerial device shall then be positioned between 0 degrees and 10 degrees elevation and extended to its maximum permissible limit.

5.9.4.2.1 The water system shall be filled with water, and the valve at the discharge end shall be closed.

CAUTION: For safety reasons, all air must be removed from the system.

5.9.4.2.2 The pressure on the system shall be raised to the water system manufacturer’s maximum-rated working pressure and maintained while the inspections required by 5.9.4.2.3 are conducted.

5.9.4.2.3 The entire length of the water system shall be checked for leaks.

5.9.4.2.4 Care shall be taken not to overheat the water pump during this test.

5.9.4.3* The water system shall operate properly and with an absence of leaks during these tests.

5.9.5 Flowmeter(s).

5.9.5.1 If the waterway system is equipped with a flowmeter(s), the flowmeter(s) shall be tested at the water system manufacturer’s maximum-rated water system flow.

5.9.5.2 Any meter that reads off by more than 10 percent shall be recalibrated, repaired, or replaced.

5.9.6 Pressure Gauge(s).

5.9.6.1 If the waterway system is equipped with a water pressure gauge(s), each water pressure gauge shall be checked at 200 psi (14 bar) for accuracy.

5.9.6.2 Any gauge that reads off by more than 10 psi shall be recalibrated, repaired, or replaced.

5.9.7 If the waterway system is equipped with a relief valve, this relief valve shall be checked to verify that it is operational at the waterway manufacturer’s recommended pressure setting.

5.10 Signs. All signs shall be inspected to verify they are in place and legible.

5.11* Hydraulic Fluid. After the operational tests have been performed, a sample of the hydraulic fluid shall be removed from the hydraulic reservoir and subjected to spectrochemical analysis, particle count, viscosity check, and water content analysis.

5.12* Records. A comprehensive record shall be completed for all tests of the aerial ladder and signed by the person responsible for the test.

5.12.1 When the torque verification of mounting bolts is performed as required by this standard, the bolt size, grade, and torque specifications shall be recorded.

5.12.2 When NDT is conducted, the test record shall indicate the NDT method used in each inspected area.

5.12.3 Where this standard requires measurements to be taken—such as bearing clearance and backlash, cylinder drift, relief pressure, ladder section twist, hardness readings, base rail thickness, extension brake drift, winch drift, and the like—these measurements shall be recorded in the test record so that a year-to-year comparison can be made.

Chapter 6 Inspecting and Testing Elevating Platforms

6.1 General.

6.1.1 In addition to the manufacturer’s recommendations for annual inspections and tests, the inspections and tests detailed in Sections 6.2 through 6.15 shall be performed.
6.6.2 Platform Mounting Brackets. The platform mounting brackets shall be inspected as follows:

1. Visually inspect all platform mounting brackets for defects, such as weld cracks, dents, or bends.
2. (+) Inspect all welds in the platform mounting brackets.
3. (+) Inspect all bolts and pins structurally involved with the platform mounting to the ladder or boom for internal flaws.

6.6.3 Platform. The platform shall be inspected as follows:

1. Visually inspect the platform for defects, such as weld cracks, dents, or bends.
2. (+) Inspect all welds on the platform.

6.6.4 Hydraulic, Pneumatic, and Electrical Lines in the Platform. All hydraulic, pneumatic, and electrical lines shall be inspected for proper mounting, wear, cracking, kinks, and abrasions.

6.6.5 Auxiliary Winch Mounting. The auxiliary winch mounting shall be inspected as follows:

1. Inspect all mounting bolts for proper grade and installation as specified by the apparatus manufacturer.
2. Using a calibrated torque wrench, verify that the torque on all winch mounting bolts meets the apparatus manufacturer’s specifications.
3. If welded, visually inspect the winch mounting for weld fractures.
4. (+) Inspect the mounting bolts for internal flaws.
5. (+) If brackets are welded, inspect all welds on the mounting brackets.

6.6.6 Winch Controls. The winch controls shall be inspected as follows:

1. Inspect controls for proper identification as to function and operation.
2. Verify smooth operation of the winch controls.

6.6.7 Elevating Platform Rated Capacity Identification. The elevating platform rated capacity identification plate shall be checked to verify that it is present, proper, and legible.

6.6.8 Platform Gate Latches and Hinge Points.

6.6.8.1 The platform gate latches shall be inspected for proper alignment.
6.6.8.2 The latch and hinges shall be inspected for smooth operation.

6.6.9 Platform Hinge Pins. The platform hinge pins shall be inspected as follows:

1. Inspect platform hinge pins for proper installation, lubrication, and any irregularities.
2. (+) Inspect the platform hinge pins for internal flaws.

6.6.10 Platform Controls. The platform controls shall be inspected as follows:

1. Inspect the platform operating controls to ensure control handles are not damaged or missing, functions are identified, and operating instructions and warnings are posted.
2. Verify that the controls operate smoothly, return to neutral when released, and do not bind during operation.
3. Verify that the turntable or lower controls will override the platform controls.

6.6.11 Platform Monitor and Nozzle. The platform monitor and nozzle shall be inspected as follows:

1. Inspect the complete operation of the platform monitor and nozzle.
2. Inspect the monitor’s mounting brackets for any defects and their welds for fractures.

6.6.12 Boom Illumination. The operation of spotlights used to illuminate the boom shall be verified.

6.7 Articulating Boom—Lower Boom Inspection and Test. For apparatus equipment with an articulating boom, the lower boom shall be inspected and tested in accordance with 6.7.1 through 6.7.14.

6.7.1 Hinge Pins. The hinge pins shall be inspected as follows:

1. Inspect the boom hinge pins for proper installation, lubrication, operation, and any discontinuities.
2. (+) Inspect the boom hinge pins for internal flaws.

6.7.2 Lower Boom Elevation Cylinder Anchor Ears and Plates. The lower boom elevation cylinder anchor ears and plates shall be inspected as follows:

1. Visually inspect the anchor ears and plates for defects and the attaching welds for fractures.
2. (+) Inspect all welds on the anchor ears and plates.

6.7.3 Lower Boom Elevation Cylinders.

6.7.3.1 The boom elevation cylinder shall be inspected as follows:

1. Inspect the cylinder rod(s) for pitting, scoring, or other defects.
6.7.12.1 The boom support shall be inspected as follows:

(1) Inspect the boom support for wear and proper alignment, and the cradle pad for damage.

(2) Visually inspect the boom support for defects, such as weld cracks, dents, or bends.

(3) (+) Inspect the boom support welds and bracket attachment.

6.7.12.2 If the boom support is bolted, it shall be further inspected as follows:

(1) Inspect all accessible bolts for proper grade and installation as specified by the apparatus manufacturer.

(2) Using a properly calibrated torque wrench, verify that the bolt torque on all accessible bolts meets the apparatus manufacturer’s specification.

(3) (+) Inspect all accessible bolts for internal flaws.

6.7.13 Lower Boom Angle Indicator Lights. The lower boom angle indicator lights shall be inspected to verify that they are operating properly.

6.7.14 Pneumatic and Electrical Lines. All pneumatic and electrical lines in the lower boom and the knuckle shall be inspected for proper mounting, wear, cracking, kinks, and abrasions.

6.8 Articulating Boom

6.8.1 Upper Boom for Alignment with Lower Boom. For apparatus equipment with an articulating boom, the upper boom shall be inspected and tested in accordance with 6.8.1 through 6.8.15.

6.8.2 Platform Leveling Linkages. The platform leveling linkages shall be inspected as follows:

(1) Visually inspect linkages for defects, such as weld cracks, dents, and bends.

(2) (+) Inspect the cylinder link pins for internal flaws.

6.8.3 Boom Boost Cylinder Brackets. The boom boost cylinder brackets shall be inspected as follows:

(1) Visually inspect the boom boost cylinder brackets for defects, such as weld cracks, dents, or bends.

(2) (+) Inspect the boom boost cylinder bracket welds.

6.8.4 Boom Boost Cylinders. The boom boost cylinders shall be inspected for any external hydraulic fluid leakage.

6.8.5 Cylinder Link Pins. The cylinder link pins shall be inspected as follows:

(1) Visually inspect the cylinder link pins for proper installation, lubrication, operation, and any irregularities.

(2) (+) Inspect the cylinder link pins for internal flaws.

6.8.6 Boom Assembly. The upper boom assembly shall be inspected as follows:

(1) Visually inspect the boom for defects, such as weld cracks, dents, or bends.

(2) Visually inspect all structural fasteners and fastener connections for cracked fasteners and material cracks around the fasteners.

(3) (+) Inspect all welds on the boom.

(4) (+) Take hardness readings at intervals of 28 in. (710 mm) or less on booms that are constructed of aluminum, and compare the results of this inspection with the manufacturer’s specifications for the hardness of the material used for construction of the boom assembly.

6.8.7 Hydraulic Lines and Hose in Upper Boom. All hydraulic lines and hose in the upper boom shall be inspected for proper mounting, abrasions, hydraulic fluid leakage, and wear.
6.8.8 Cables, Chains, and Rods. All cables, chains, and rods shall be inspected for signs of wear and for proper adjustment.

6.8.9 Sprockets, Pulleys, and Hooks. All sprockets, pulleys, and hooks shall be inspected for proper lubrication, signs of wear, distortion, and proper operation.

6.8.10 Upper Boom Hold-Down Device. The upper boom hold-down device shall be inspected as follows:

1. Visually inspect the upper boom hold-down device for defects and for proper operation.
2. (+) Inspect all welds of the upper boom hold-down device.

6.8.11 Safety Stop Mechanism. Verify that the safety stop mechanism operates properly.

6.8.12 Upper Boom Elevation Cylinder Anchor Ears and Plates. The upper boom elevation anchor ears and plates shall be inspected as follows:

1. Visually inspect the anchor ears and plates for defects and the welds for fractures.
2. (+) Inspect all welds on the anchor ears and plates.

6.8.13 Upper Boom Elevation Cylinder(s).

6.8.13.1 The upper boom elevation cylinder(s) shall be inspected as follows:

1. Inspect the cylinder rod(s) for pitting, scoring, and other defects.
2. (+) Inspect the cylinder rod-to-barrel seal and the end gland seal for external hydraulic fluid leakage that exceeds the manufacturer’s specifications.

6.8.13.2 The upper boom elevation cylinder shall be subjected to a drift test as follows:

1. With the hydraulic fluid at ambient temperature, take measurements of the drift in accordance with the manufacturer’s recommendations.
2. Verify that the results do not exceed the manufacturer’s specifications for allowable lower boom cylinder drift.

6.8.14 Holding Valves on Upper Boom Elevation Cylinder. The holding valve(s) shall be inspected for signs of external hydraulic fluid leakage.

6.8.15 Pneumatic and Electrical Lines. All pneumatic and electrical lines in the upper boom shall be inspected for proper mounting, wear, cracking, kinks, and abrasions.

6.9 Telescoping Boom Inspection and Test. For platforms equipped with a telescoping boom, the boom shall be inspected and tested in accordance with 5.4.14 through 5.4.17, 6.7.10 through 6.7.12, and 6.9.1 through 6.9.14.

6.9.1 Boom Assemblies. The boom assemblies shall be inspected as follows:

1. Visually inspect booms for defects, such as weld cracks, dents, or bends.
2. Visually inspect all structural fasteners and fastened connections for cracked fasteners and material cracks around the fasteners.
3. (+) Inspect all welds on booms.
4. (+) Take hardness readings at intervals of 28 in. (710 mm) or less on booms that are constructed of aluminum, and compare the results of this inspection with the manufacturer’s specifications for the hardness of the material used for construction of the boom assembly.

6.9.2 Ancillary Boom Ladder. The ancillary boom ladder shall be inspected as follows:

1. Inspect the ancillary boom ladder for any defects and the welds for fractures.
2. (+) Inspect the mounting brackets for loose bolts, weld fractures, or other defects.
3. (+) Inspect all welds on the ladder and attaching welds.

6.9.3 Guides, Wear Strips and Pads, and Slide Blocks. Guides, wear strips and pads, and slide blocks shall be inspected for proper installation and signs of wear.

6.9.4 Extension Sheaves. The extension sheaves shall be inspected as follows:

1. Inspect the extension sheaves for proper mounting, alignment, and signs of wear.
2. (+) Inspect all welds of the extension sheave mounting brackets.
3. (+) Inspect retaining bolt for internal flaws.

6.9.5 Extension Cables. Extension cables shall be inspected for compliance with Appendix A of SAE J959, Lifting Crane, Wire-Rope Strength Factors.

6.9.6 Elevation Indicator. The elevation cylinder indicator shall be inspected for legibility and clarity.

6.9.7 Maximum Extension Warning Device. During operation, if the elevating platform is equipped with an audible device that warns of the approach of maximum extension, the device shall be inspected to verify proper operation.

6.9.8 Platform Leveling Cylinders. The platform leveling cylinders shall be inspected as follows:

1. Inspect the cylinder rod(s) for pitting, scoring, and other defects.
2. Inspect the cylinder rod-to-barrel seal and the end gland seal for external hydraulic fluid leakage that exceeds the manufacturer’s specifications.
3. Visually inspect the leveling system for proper installation.
4. Visually inspect the mounting of the leveling system for defects and the welds for fractures.
5. (+) Inspect all welds for mounting of the leveling system.
6. (+) Inspect all cylinder pins for any internal flaws.

6.9.9 Hydraulic Lines and Hose in Boom Assemblies. All hydraulic lines and hose in the boom assemblies shall be inspected for hydraulic fluid leakage, abrasions, and any signs of wear.

6.9.10 Extension Cylinder Anchor Ears and Plates. The extension cylinder anchor ears and plates shall be inspected as follows:

1. Visually inspect the extension cylinder anchor ears and plates for defects and the attaching welds for fractures.
2. (+) Inspect the extension cylinder anchor ears and the plate-attaching welds.

6.9.11 Extension Cylinder Pins. The extension cylinder pins shall be inspected as follows:

1. Inspect the cylinder pins for proper installation and retention.
2. (+) Inspect the cylinder pins for internal flaws.

6.9.12 Extension Cylinder.

6.9.12.1 The extension cylinders shall be inspected as follows:
6.11 Operational Tests from Platform Controls.

6.11.1 With engine speed set to allow maximum speed as permitted by the manufacturer, the elevating platform shall be operated from the platform control station through all positions, as allowed by the manufacturer, with only the operator in the platform.

6.11.2 The operation of the elevating platform shall include, but not be limited to, movement of the platform from ground to maximum elevation, as well as revolving the platform 360 degrees to the left and to the right while the unit is at its maximum horizontal reach.

6.11.3 All safety devices shall operate properly.

6.11.4 The platform deactivation control, from the ground or lower controls, shall be demonstrated to operate properly.

6.11.5 The platform shall level properly as the booms are moved through all allowable positions.

6.11.6 The mechanical override on a hydraulically leveled platform shall operate properly during emergency lowering of the boom without hydraulic power.

6.12 Load Test.

6.12.1 The aerial apparatus shall be positioned on a hard, level surface with room for unrestricted boom movements. The stabilizers shall be deployed in accordance with the manufacturer's instructions.

6.12.2 A close watch shall be maintained during all load tests for any signs of instability, the development of conditions that could cause damage or permanent deformation, or twist that exceeds the elevating platform manufacturer’s allowance. The test shall be discontinued immediately if such conditions develop.

6.12.3 The platform shall be loaded as follows.

(a) The platform shall be placed near the ground and shall be loaded to the elevating platform’s rated capacity minus the weight of equipment added to the platform after delivery.

(b) The platform load shall be secured properly.

6.12.4 The unit shall be operated from the lower controls through all allowable phases of operation. The manufacturer’s operational limits shall not be exceeded.

6.12.5 All boom movements shall exhibit no abnormal noise, vibration, or deflection.

6.12.6 The platform shall level properly as the booms are moved through all allowable positions.

6.12.7 At the conclusion of the load test, weld joints at stabilizer structure, stabilizers, frame, main frame, frame reinforcements, turntable, cylinder anchors, boom joints, leveling system, platform, and pivot pin bosses shall be inspected and shall show no signs of deterioration.

6.13 Water System Inspection and Test.

6.13.1 The waterway system shall be inspected as follows:

1. Inspect the system for proper operation of all components.

2. Inspect the system for rust, corrosion, blockage, or other defects.

6.13.2 The waterway attaching brackets shall be inspected as follows:

1. Inspect the brackets for loose bolts, weld fractures, or other defects.

2. (+) Inspect all attaching welds.

6.13.3 Pressure Test. The water system shall be pressure tested.

6.13.3.1 If the elevating platform has a telescoping boom, the water system shall be tested following the procedure in 5.9.4.1 and 5.9.4.2.
Chapter 7 Inspecting and Testing Water Towers

7.1 General.

7.1.1 In addition to the manufacturer’s recommendations for annual inspections and tests, the inspections and tests detailed in Sections 7.2 through 7.13 shall be performed.

7.1.2 An inspection preceded by a plus sign (+) indicates that an appropriate nondestructive test (NDT) shall be conducted as required by 4.1.2 and 4.1.3 of this standard.

7.2 Service Records. The water tower’s service records shall be checked for any reports that indicate defective conditions.

7.3 Hydraulic Components. Hydraulic components shall show no signs of hydraulic fluid leakage.

7.3.1 A component shall be considered leaking if hydraulic fluid (oil) droplets are forming on the component.

7.3.2 A film of hydraulic fluid on the component shall not be considered severe enough to categorize the component as leaking.

7.4 Turntable and Torque Box Inspection and Test. The turntable and torque box components, where applicable, shall be inspected on all water tower apparatus in accordance with 5.4.1 through 5.4.2 and 5.4.4 through 5.4.29.

7.5 Stabilizer Inspection and Test. The stabilizer components, where applicable, shall be inspected on all water tower apparatus in accordance with 5.5.1 through 5.5.13.

7.6 Aerial Ladder Inspection and Test. For a water tower apparatus that is equipped with an aerial ladder, the aerial ladder shall be inspected and tested in accordance with Section 5.6 and Section 5.8.

7.7 Articulating Boom–Lower Boom Inspection and Test. For a water tower apparatus that is equipped with an articulating boom, the lower boom shall be inspected and tested in accordance with 6.7.1 through 6.7.6 and 6.7.8 through 6.7.14, as applicable.

7.8 Articulating Boom–Upper Boom Inspection and Test. For a water tower apparatus that is equipped with an articulating boom, the upper boom shall be inspected and tested in accordance with 6.8.1 and 6.8.3 through 6.8.15, as applicable.

7.9 Telescoping Boom Inspection and Test. For a water tower apparatus that is equipped with a telescoping boom, the boom shall be inspected and tested in accordance with 6.7.10 through 6.7.14, 6.9.1 through 6.9.7, and 6.9.9 through 6.9.14, as applicable.

7.10 Operating Test.

7.10.1 After starting the engine, setting the stabilizers, and transmitting power to the water tower, the water tower shall be fully elevated out of the bed, rotated 90 degrees, and extended to full extension.

7.10.2 The water tower shall complete the procedure defined in 7.10.1 smoothly and without undue vibration within the time allowed by the edition of NFPA 1901, Standard for Automotive Fire Apparatus, in effect at the time of manufacture.

7.10.3 The water tower shall be retracted, the turntable rotation shall be completed through 360 degrees, and then the water tower shall be lowered to its bed, after which a thorough inspection shall be made of all moving parts.

7.10.4 The test shall demonstrate successful operation of all water tower controls.

7.11 Water System Inspection and Test.

6.13.3.2 If the elevating platform has an articulating boom, the water system shall be tested as follows:

(1) The boom shall be positioned in the road travel position.

(2) If there is not a valve at the discharge end of the water system, a valve shall be attached for the purpose of this test.

(3) The water system shall be filled with water, and the valve at the discharge end shall be closed.

CAUTION: For safety reasons, all air must be removed from the system.

6.13.3.3 If the elevating platform has both a telescoping boom and an articulating boom, it shall be tested in accordance with 6.13.3.1 and 6.13.3.2.

6.13.3.4* The water system shall operate properly and with an absence of leaks during these tests.

6.13.4 Flowmeter(s).

6.13.4.1 If the waterway system is equipped with a flowmeter(s), the flowmeter(s) shall be tested at the water system manufacturer’s maximum-rated water system flow.

6.13.4.2 Any meter that reads off by more than 10 percent shall be recalibrated, repaired, or replaced.

6.13.5 Pressure Gauge(s).

6.13.5.1 If the waterway system is equipped with a water pressure gauge(s), each water pressure gauge shall be checked at 200 psi (14 bar) for accuracy.

6.13.5.2 Any gauge that reads off by more than 10 psi shall be recalibrated, repaired, or replaced.

6.13.6 If the waterway system is equipped with a relief valve(s), the relief valve(s) shall be checked to verify that it is operational at the waterway manufacturer’s recommended pressure setting.

6.14 Signs. All signs shall be inspected to verify they are in place and legible.

6.15* Hydraulic Fluid. After the operational tests have been performed, a sample of the hydraulic fluid shall be removed from the hydraulic reservoir and subjected to spectrochemical analysis, particle count, viscosity check, and water content analysis.

6.16* Records. A comprehensive record shall be completed for all tests of the elevating platform and signed by the person responsible for the test.

6.16.1 When the torque verification of mounting bolts is performed as required by this standard, the bolt size, grade, and torque specifications shall be recorded.

6.16.2 When NDT is conducted, the test record shall indicate the NDT method used in each inspected area.

6.16.3 Where this standard requires measurements to be taken—such as bearing clearance and backlash, cylinder drift, relief pressure, ladder section twist, hardness readings, base rail thickness, extension brake drift, winch drift, and the like—these measurements shall be recorded in the test record so that a year-to-year comparison can be made.
7.11.1 The waterway system shall be inspected as follows:

(1) Inspect the system for proper operation of all components.
(2) Inspect the system for rust, corrosion, blockage, or other defects.

7.11.2 The waterway-attaching brackets shall be inspected as follows:

(1) Inspect the brackets for loose bolts, weld fractures, or other defects.
(2) (+) Inspect all attaching welds.

7.11.3 Pressure Test. The water system shall be pressure tested.

7.11.3.1 If the water tower has a telescoping boom, the water system shall be tested following the procedures in 5.9.4.1 and 5.9.4.2.

7.11.3.2 If the water tower has an articulating boom, the water system shall be tested following the procedure in 6.13.3.2.

7.11.3.3 If the water tower has both a telescoping boom and an articulating boom, it shall be tested in accordance with 7.11.3.1 and 7.11.3.2.

7.11.3.4* The water system shall operate properly and with an absence of leaks during these tests.

7.11.4 Flowmeter(s).

7.11.4.1 If the waterway system is equipped with a flowmeter(s), the flowmeter(s) shall be tested at the water system manufacturer’s maximum-rated water system flow.

7.11.4.2 Any meter that reads off by more than 10 percent shall be recalibrated, repaired, or replaced.

7.11.5 Pressure Gauge(s).

7.11.5.1 If the waterway system is equipped with a water pressure gauge(s), each water pressure gauge shall be checked at 200 psi (14 bar) for accuracy.

7.11.5.2 Any gauge that reads off by more than 10 psi shall be recalibrated, repaired, or replaced.

7.11.6 If the waterway system is equipped with a relief valve, this relief valve shall be checked to verify that it is operational at the waterway manufacturer’s recommended pressure setting.

7.12 Signs. All signs shall be inspected to verify that they are in place and legible.

7.13* Hydraulic Fluid. After the operational tests have been performed, a sample of the hydraulic fluid shall be removed from the hydraulic reservoir and subjected to spectrochemical analysis, particle count, viscosity check, and water content analysis.

7.14* Records. A comprehensive record shall be completed for all tests of the water tower and signed by the person responsible for the test.

7.14.1 When the torque verification of mounting bolts is performed as required by this standard, the bolt size, grade, and torque specifications shall be recorded.

7.14.2 When NDT is conducted, the test record shall indicate the NDT method used in each inspected area.

7.14.3 Where this standard requires measurements to be taken—such as bearing clearance and backlash, cylinder drift, relief pressure, ladder section twist, hardness readings, base rail thickness, extension brake drift, winch drift, and the like—these measurements shall be recorded in the test record so that a year-to-year comparison can be made.

Annex A Explanatory Material

Annex A is not a part of the requirements of this NFPA document but is included for informational purposes only. This annex contains explanatory material, numbered to correspond with the applicable text paragraphs.

A.3.2.1 The phrase “authority having jurisdiction” is used in NFPA documents in a broad manner, since jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

A.3.3.44 The lifting of a tire or stabilizer on the opposite side of the vehicle from the load does not necessarily indicate a condition of instability. Instability occurs when an aerial device can no longer support a given load and overturning is imminent.

A.3.3.68 For an aerial ladder, it is measured from the top rung of the fly section; for an elevating platform, it is measured from the top of the platform handrail; and for a water tower, it is measured from the discharge end of the water monitor nozzle.

A.3.3.84 The torque box is sometimes referred to as the torsion box or main frame and can be integrated into the chassis frame design.

A.3.3.87 Some turntables contain an operator’s control station.

A.4.1.2 Full nondestructive testing can be desirable on a more frequent basis than every 5 years, depending on the service to which the aerial device is subjected. Extensive use of the aerial device in urban environments would be a reason for more frequent testing. Many departments have found aerial devices damaged not by use but by transport over rough roads that wrack the device in its bed.

A.4.1.4.1 If possible, the manufacturer of the aerial device should be consulted when structural defects are revealed by the service test in this standard. The recommendations for repair that are made by the manufacturer should be followed strictly. However, if the manufacturer is no longer in business, the authority having jurisdiction must choose a repair facility to conduct the repair work. Choosing a repair facility to perform structural repair on an aerial apparatus is a process that requires a great deal of research and careful thought. Some of the items that should be considered are the following:

(1) Does the facility have past experience with the same structural repair as your aerial device needs, and will the facility provide a reference list?
(2) Does the facility have the original design, construction, and operation specifications for the make and model of your aerial device?
(3) Does the facility have in its possession written procedures for structural repair that were developed previously by the manufacturer of your aerial device?
(4) Does the facility employ an engineering staff to analyze structures and recommend structural repair methods?
(5) Will the facility provide an engineering analysis used to substantiate the structural repair method recommended?
(6) Will the facility provide an independent certification by a professional engineer of the analysis used to substantiate the recommended structural repair method?

(7) Will the facility warrant the work performed?

A.4.1.5 Specific, written checklists, which combine the manufacturer’s recommended checks with the inspection procedures of this standard and any other checks found desirable by the department, should be developed by each fire department for its style and brand of apparatus to ensure a systematic and complete inspection.

A.4.1.6 Qualified vehicle operators are either those who have been schooled in the operation of the vehicle by the manufacturer or fire department instructors who have received special training in all phases of vehicle operations. Operators of fire department apparatus should complete a course in driver training and aerial ladder or elevating platform operational procedures, including positioning on the fireground. Specific training should be given in procedures to be followed should the hydraulic system fail. A thorough understanding of safe load capacity, stabilizing procedures, and operational limits is paramount. Safety procedures, proper shutdown, and boom-lowering procedures are also critical. Operators should be tested upon completion of training. Periodic retraining and retesting should also be required.

A.5.4.16.2 If the aerial device is operated for a considerable time period prior to the drift test, the hydraulic fluid temperature will be elevated. During the 1-hour test, the hydraulic fluid will cool to ambient temperature, and it can change in volume by 3 to 4 percent, leading to erroneous test results.

A.5.6.8 Some hollow I-beam aerial ladders’ base rails have an additional layer of sheet metal spot welded to the bottom of the base rail on the ladder section. This additional metal is commonly known as a glove. Base rails constructed in this manner are susceptible to corrosion between the inside of the glove and the outside of the base rail when water is trapped in this area. This corrosion is not detected easily, as the area inside the glove cannot be inspected visually unless the glove is removed. If any corrosion or rust can be seen bleeding from the glove, the manufacturer should be contacted and the glove removed to determine whether corrosion has weakened the base rail.

A.5.8.1 A strong wind on the long cable and test load will introduce a pendulum action that will potentially add load to the ladder far beyond the test weight.

A.5.8.4.2 Figure A.5.8.4.2 diagrams such a hanger.

Figure A.5.8.4.2 Hanger for test cable. (Existing A-2.7.3.2, 97 ed., no change)

A.5.8.4.8 Figure A.5.8.4.8 shows an example of a test weight container.

Figure A.5.8.4.8 Test weight container. (Existing A-2.7.3.9, 97 ed., no change)

A.5.8.5.2 See Figure A.5.8.4.2.

A.5.9.4.1 The purpose of this test is primarily to detect water leaks in the turntable center swivel area. However, leaks in other areas also could be detected during this test.

A.5.9.4.1.2 It is recommended that a valve or restricting orifice plate be placed in the hose line where it connects to the ladder pipe intake to throttle the water entering the system. This precaution allows only a controlled flow if a component breaks during the test.

A.5.9.4.2 The purpose of this test is primarily to detect water leaks in the seals between the telescoping water pipes. However, leaks in other areas also could be detected during this test.

A.5.9.4.3 It is recognized that fittings could drip slightly during the test and such dripping is acceptable. However, any steady leak is a sign of a developing problem that should be corrected.

A.5.11 Spectrochemical analysis of the hydraulic fluid is intended to identify contaminants in the hydraulic system. Typically, the analysis will identify contaminants in parts per million (ppm) or by percent. Many laboratories that perform the analysis will provide service recommendations with their hydraulic fluid analysis report. In most cases, recommendations are limited unless a reference analysis has been performed. The reference analysis is an analysis of new hydraulic fluid from the fluid manufacturer/supplier prior to being put into the aerial hydraulic system. Subsequent hydraulic fluid analyses are then compared to the reference analysis. By comparing the contaminant levels, trends can be identified and can give the analyzing laboratory specific service recommendations.

A.5.12 Annex B shows a form that can be used to record the results of the inspection and test. This form can be supplemented with other data specific to the aerial device being inspected and tested.

A.6.13.3.2 It is recommended that a valve or restricting orifice plate be placed in the hose line where it connects to the elevator platform intake to throttle the water entering the system. This precaution allows only a controlled flow if a component breaks during the test.

A.6.13.3.4 It is recognized that fittings could drip slightly during the test, and such dripping is acceptable. However, any steady leak is a sign of a developing problem that should be corrected.

A.6.15 See A.5.11.

A.6.16 See A.5.12.

A.7.11.3.4 It is recognized that fittings could drip slightly during the test, and such dripping is acceptable. However, any steady leak is a sign of a developing problem that should be corrected.

A.7.13 See A.5.11.

Annex B Inspection and Test Form

This annex is not a part of the requirements of this NFPA document but is included for informational purposes only.

B.1 Figure B.1 can be useful for recording the results of the inspection and test. This form can be supplemented as necessary to record details specific to a particular aerial device.
